# What is TAU?

---

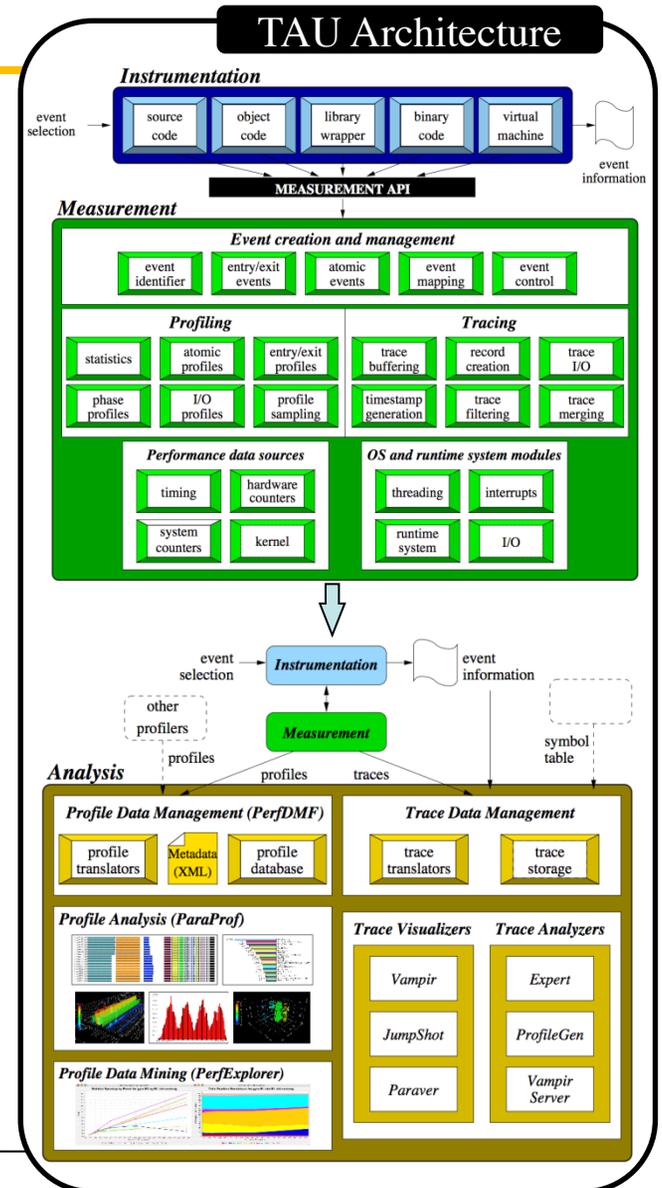

- TAU is a performance evaluation tool
- It supports parallel profiling and tracing toolkit
- Profiling shows you how much (total) time was spent in each routine
- Tracing shows you *when* the events take place in each process along a timeline
- Profiling and tracing can measure time as well as hardware performance counters from your CPU
- TAU can automatically instrument your source code (routines, loops, I/O, memory, phases, etc.)
- It supports C++, C, UPC, Fortran, Python, and Java
- TAU runs on all HPC platforms and it is free (BSD style license)
- TAU has instrumentation, measurement and analysis tools
- To use TAU, you need to set a couple of environment variables and substitute the name of the compiler with a TAU shell script

# TAU Performance System®

- Integrated toolkit for performance problem solving
  - Instrumentation, measurement, analysis, visualization
  - Portable performance profiling and tracing facility
  - Performance data management and data mining
- Supports both direct as well as indirect (sampling) performance measurement approach
- Open source
- Available on all HPC platforms
- <http://tau.uoregon.edu>

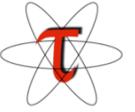

**ParaTools**

# Performance Evaluation

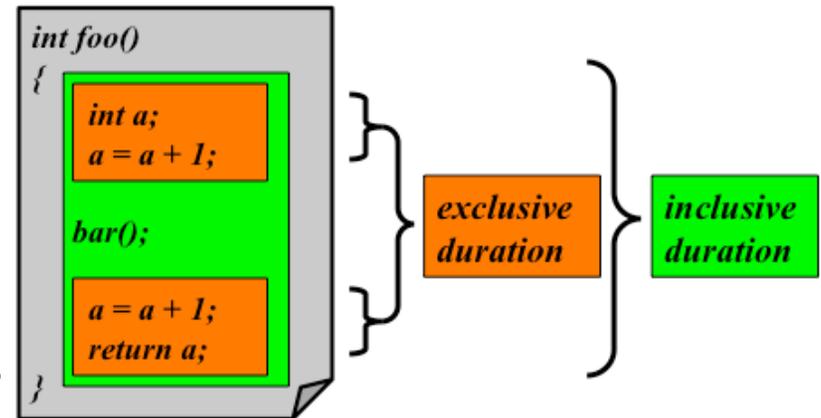

---

- Profiling
  - Presents summary statistics of performance metrics
    - number of times a routine was invoked
    - exclusive, inclusive time/hpm counts spent executing it
    - number of instrumented child routines invoked, etc.
    - structure of invocations (calltrees/callgraphs)
    - memory, message communication sizes also tracked
- Tracing
  - Presents when and where events took place along a global timeline
    - timestamped log of events
    - message communication events (sends/receives) are tracked
      - shows when and where messages were sent
    - large volume of performance data generated leads to more perturbation in the program

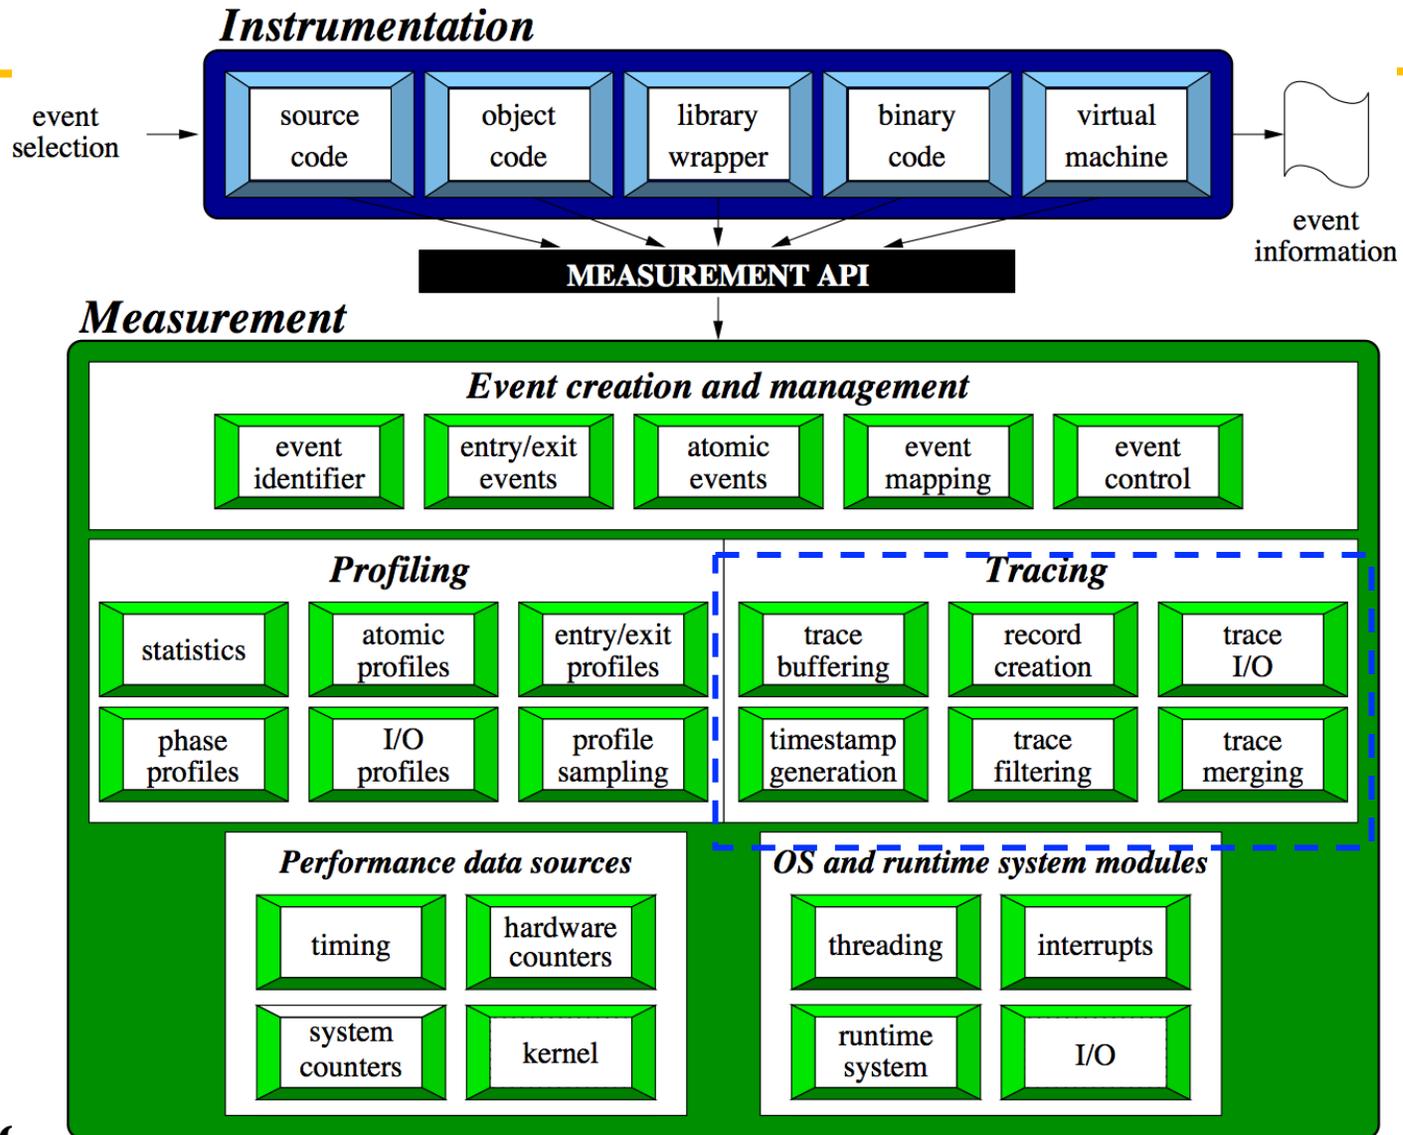

# TAU Performance Profiling

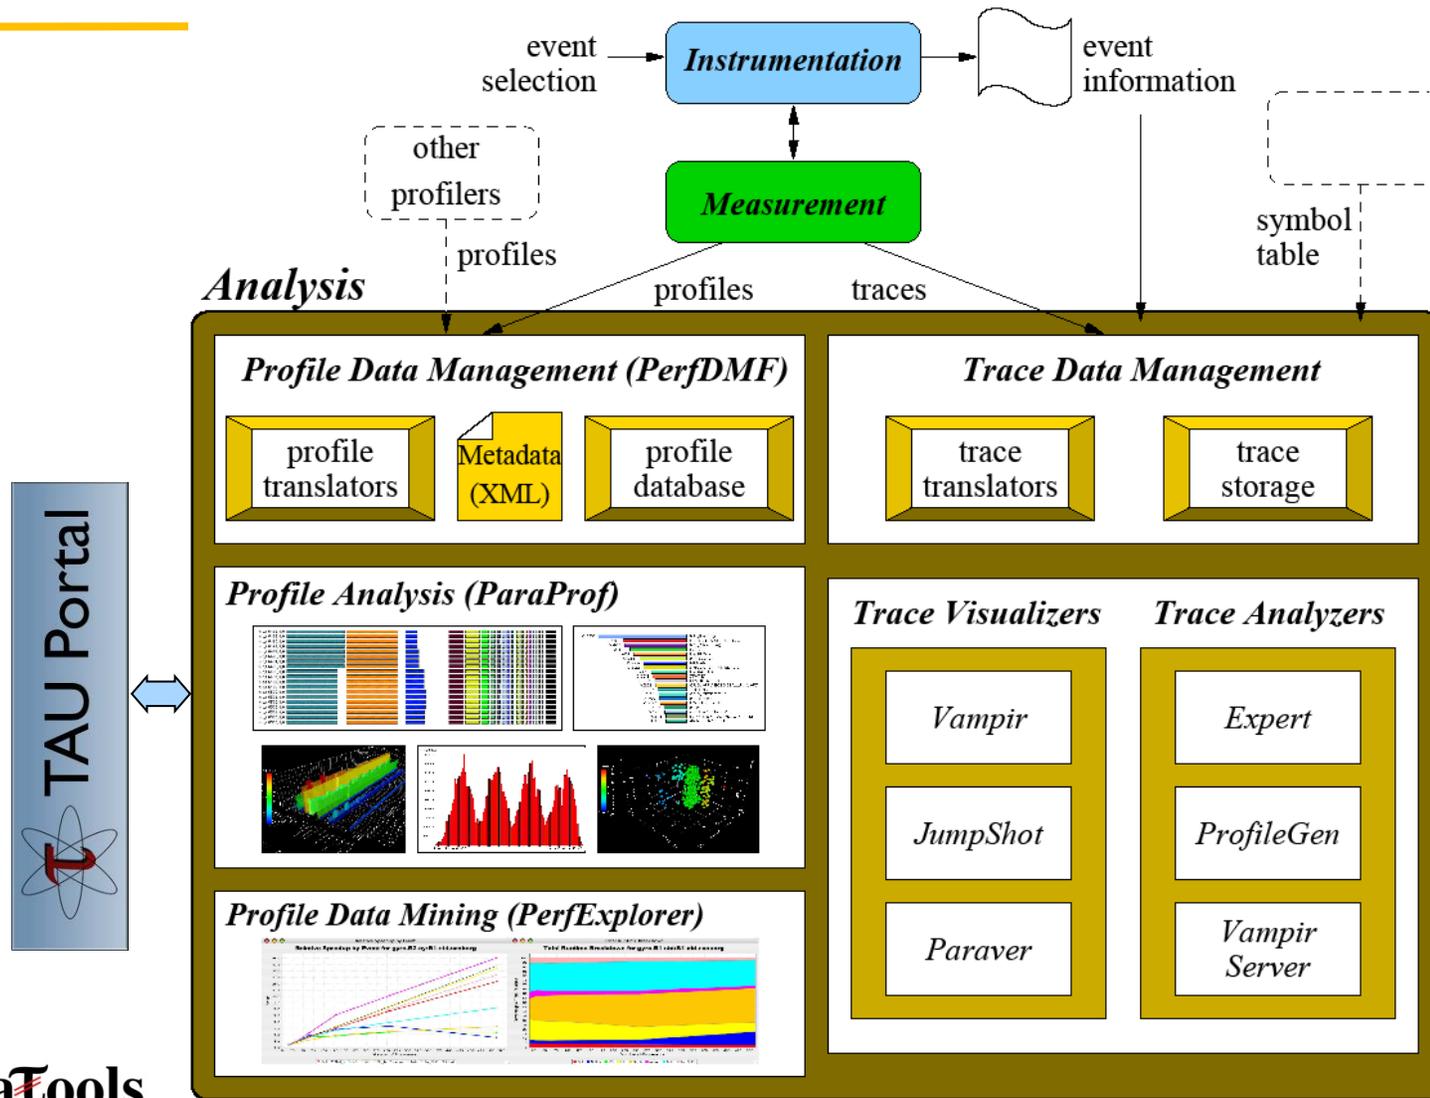

- Performance with respect to nested event regions
  - Program execution event stack (begin/end events)
- Profiling measures inclusive and exclusive data
- Exclusive measurements for region only performance
- Inclusive measurements includes nested “child” regions
- Support multiple profiling types
  - Flat, callpath, and phase profiling

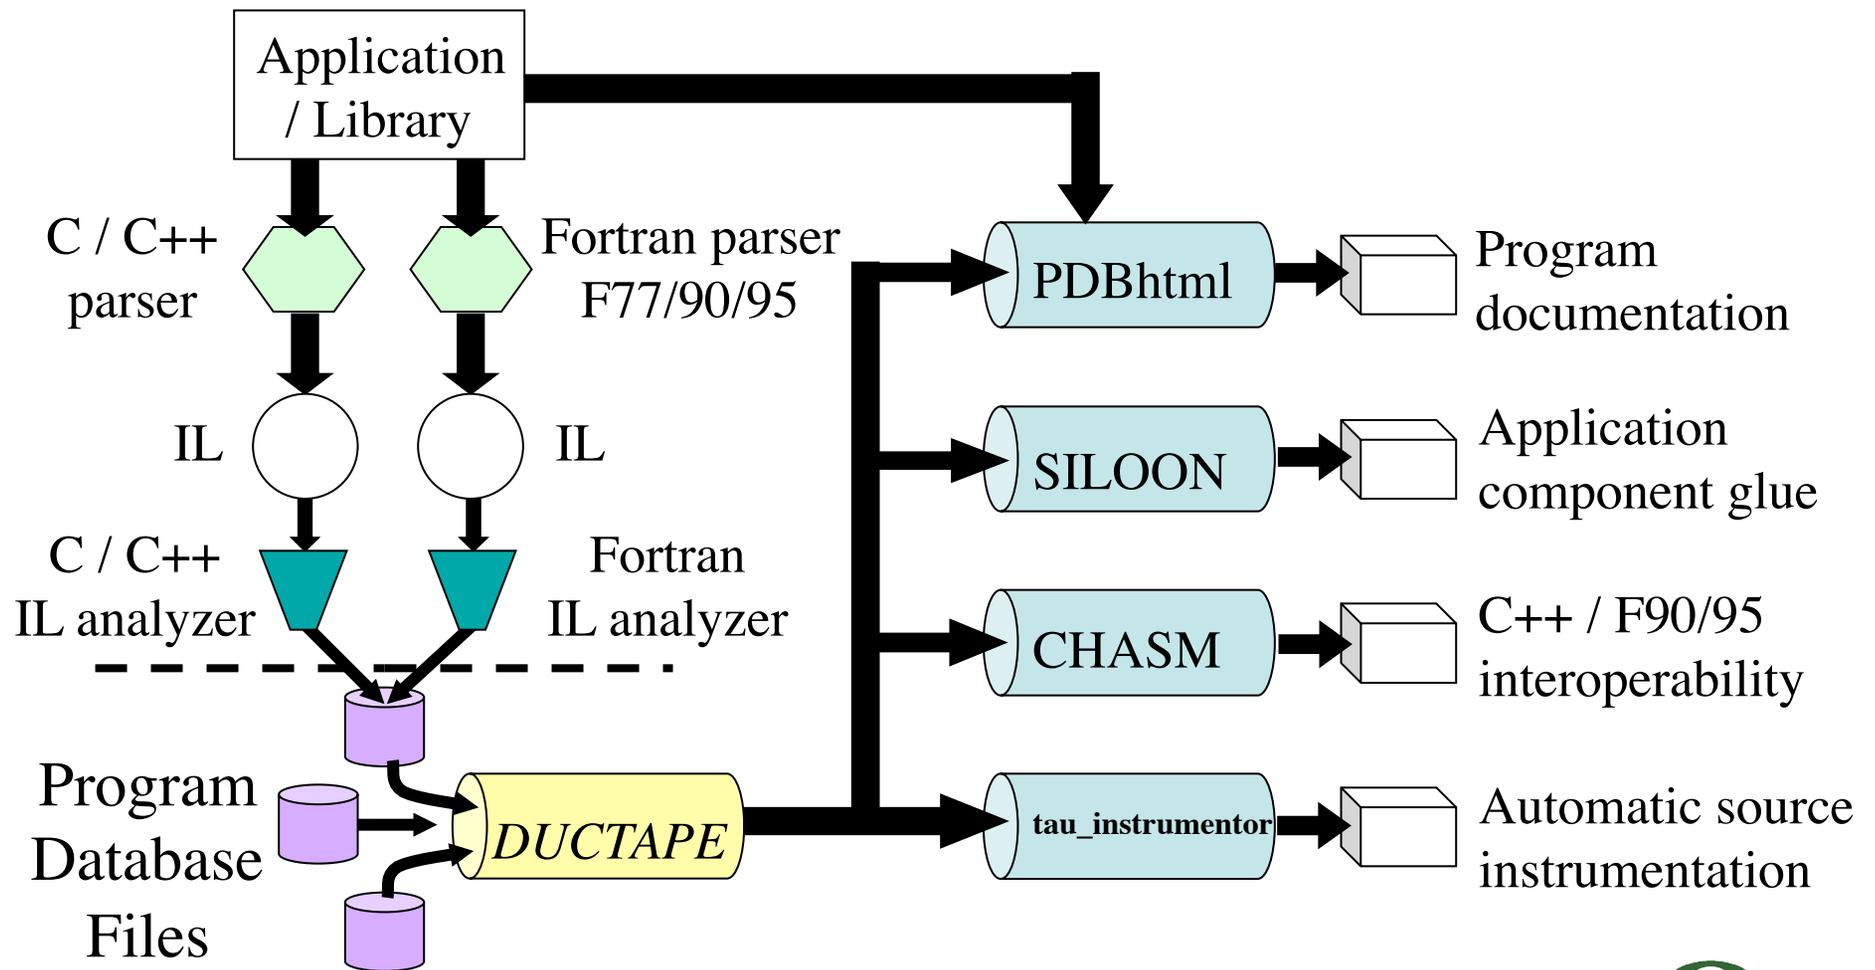

# TAU Performance System Architecture

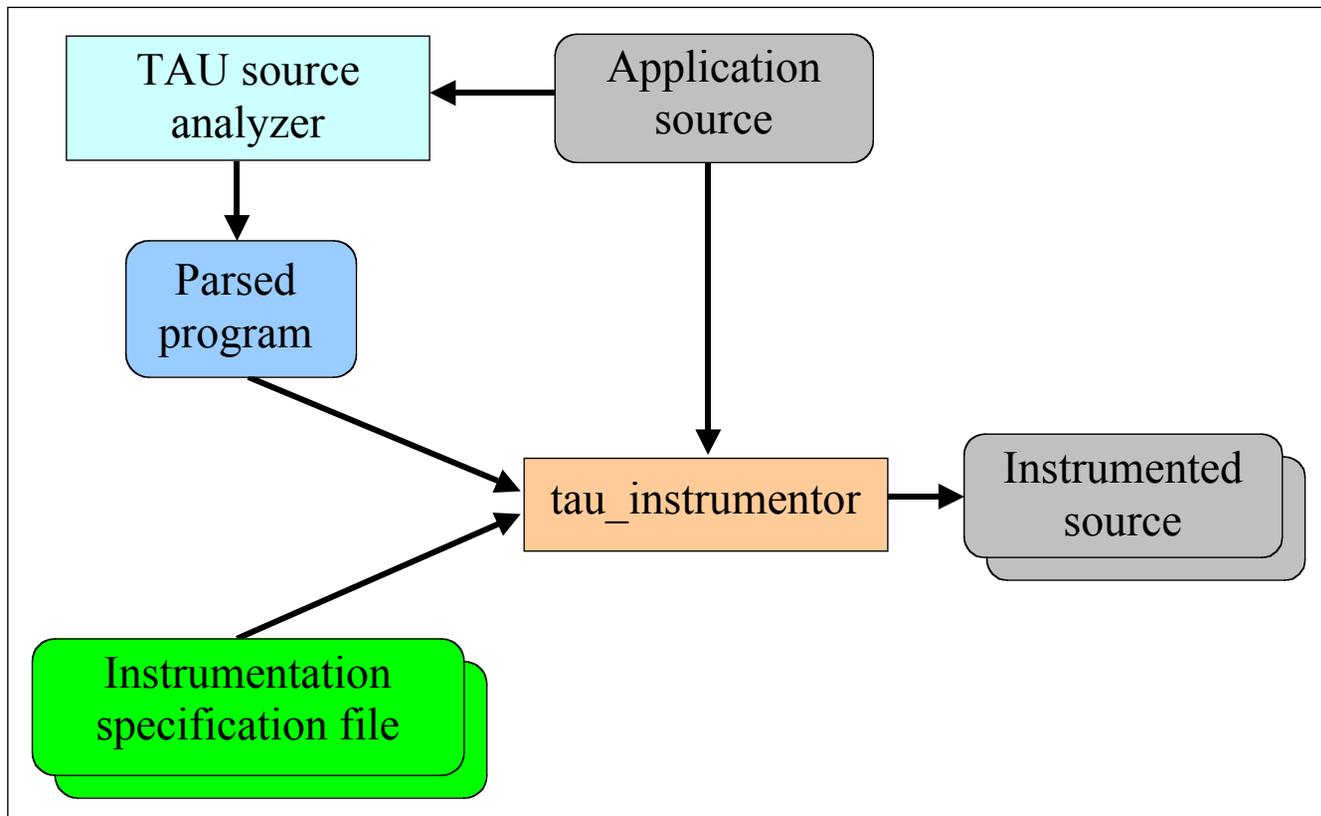

# TAU Performance System Architecture

# Program Database Toolkit (PDT)

# Automatic Source-Level Instrumentation in TAU

# Using TAU: A brief Introduction

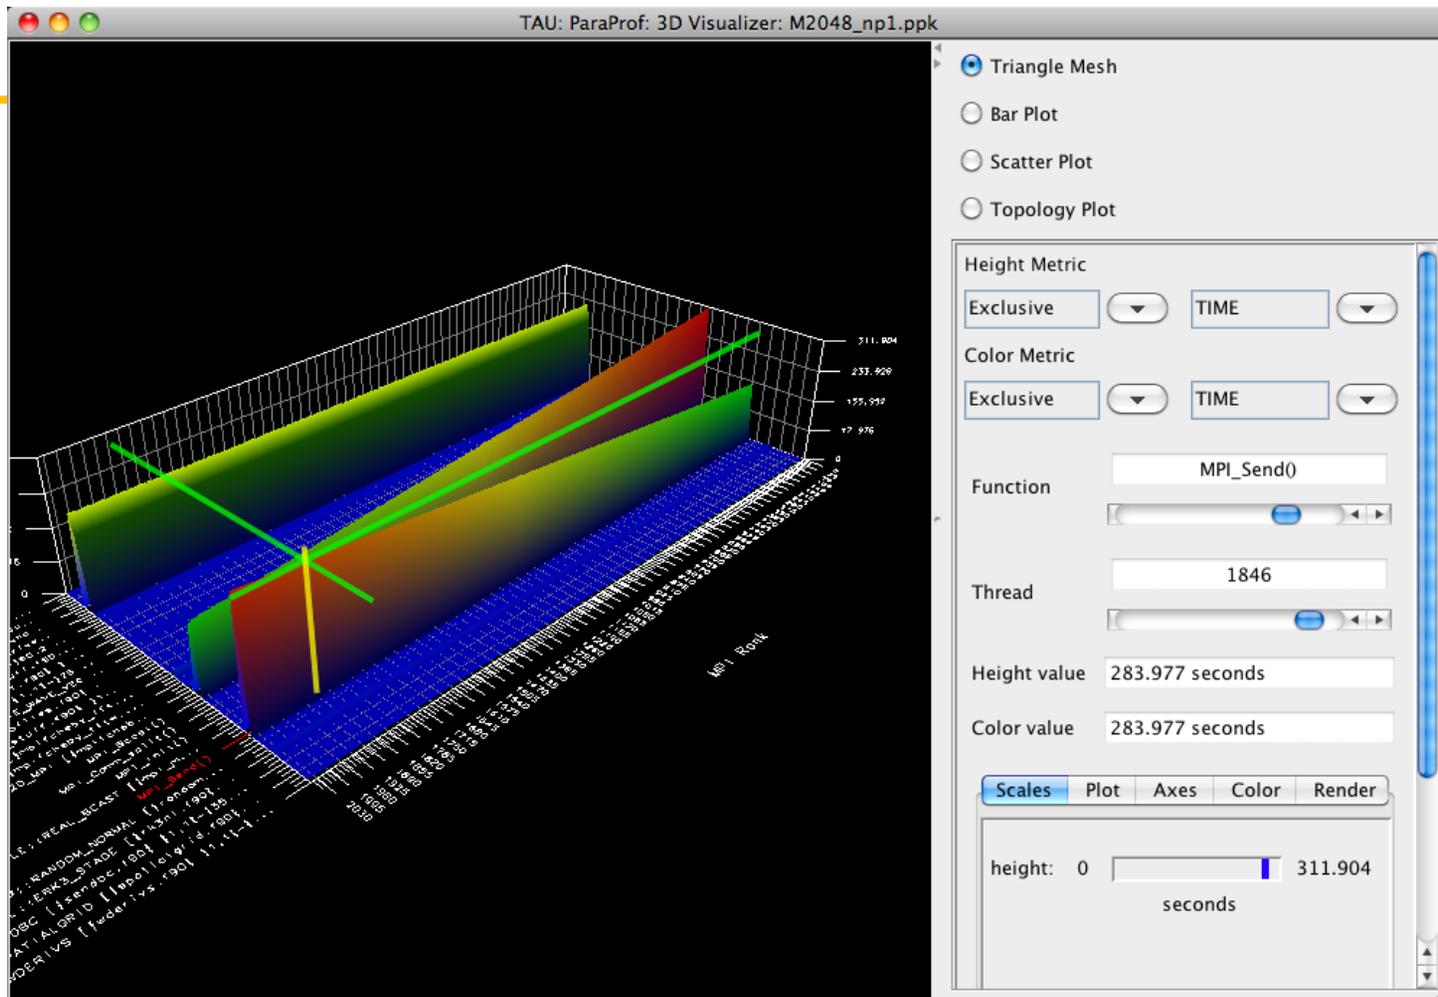

---

- TAU supports several measurement options (profiling, tracing, profiling with hardware counters, etc.)
- Each measurement configuration of TAU corresponds to a unique stub makefile that is generated when you configure it
- To instrument source code using PDT
  - Choose an appropriate TAU stub makefile in <arch>/lib:  
% **soft add +tau-latest** (on BG/Q)  
% **export TAU\_MAKEFILE=/soft/perftools/tau/tau\_latest/bgq/lib/Makefile.tau-bgqtimers-mpi-pdt**  
% **export TAU\_OPTIONS=' -optVerbose ...'** (see **tau\_compiler.sh -help**)  
And use **tau\_f90.sh**, **tau\_cxx.sh** or **tau\_cc.sh** as Fortran, C++ or C compilers:  
% **mpixlf90\_r foo.f90**  
changes to  
% **tau\_f90.sh foo.f90**  
% **qsub -A <aueue> -q R.bc -n 256 -t 10 ./a.out**
- Execute application and analyze performance data:
  - % **pprof** (for text based profile display)
  - % **paraprof** (for GUI)

# TAU Measurement Configuration on BG/Q

# Building Bridges to Other Tools

# TAU Instrumentation Approach

---

- **Support for *standard* program events**
  - Routines, classes and templates
  - Statement-level blocks
  - *Begin/End* events (*Interval* events)
- **Support for *user-defined* events**
  - *Begin/End* events specified by user
  - *Atomic* events (e.g., size of memory allocated/freed)
  - Selection of event statistics
- Support definition of “semantic” entities for mapping
- Support for event groups (aggregation, selection)
- Instrumentation optimization
  - Eliminate instrumentation in lightweight routines

Interval Event

Context Event

Atomic Event

# TAU Measurement Mechanisms

---

- **Parallel profiling**
  - Function-level, block-level, statement-level
  - Direct instrumentation as well as event based sampling
  - Supports user-defined events and mapping events
  - Support for flat, callgraph/callpath, phase profiling
  - Support for memory profiling (headroom, malloc/leaks)
  - Support for tracking I/O (wrappers, read/write/print calls)
  - Parallel profiles written at end of execution
  - Parallel profile snapshots can be taken during execution
- **Tracing**
  - All profile-level events + inter-process communication
  - Inclusion of multiple counter data in traced events

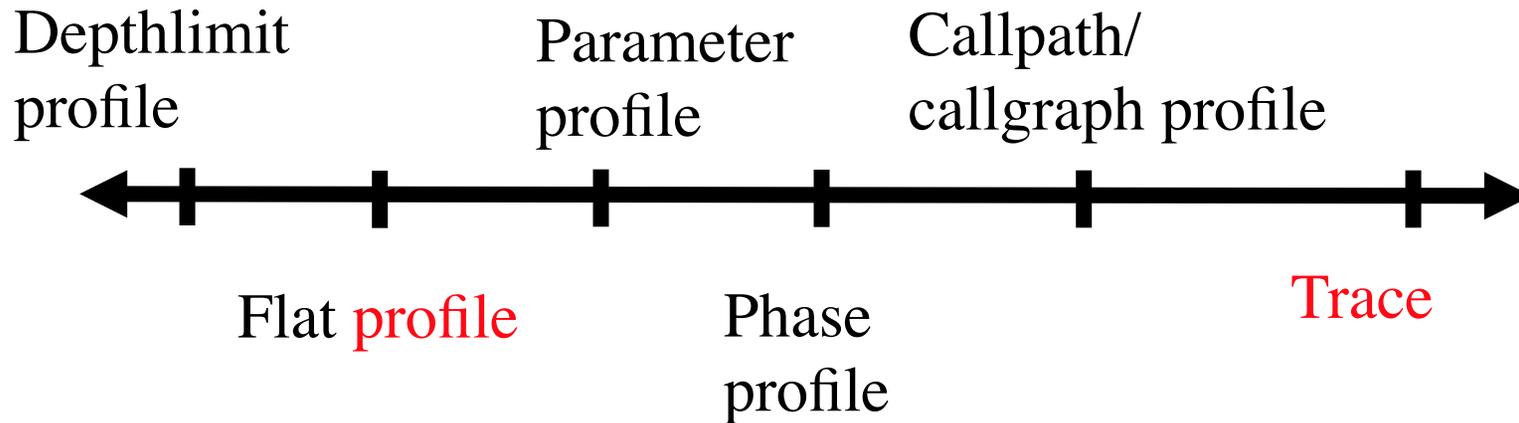

# Types of Parallel Performance Profiling

---

- **Flat** profiles
  - Metric (e.g., time) spent in an event (callgraph nodes)
  - Exclusive/inclusive, # of calls, child calls
- **Callpath** profiles (**Caldepth** profiles)
  - Time spent along a calling path (edges in callgraph)
  - “*main=> f1 => f2 => MPI\_Send*” (event name)
  - TAU\_CALLPATH\_DEPTH environment variable
- **Phase** profiles
  - Flat profiles under a phase (nested phases are allowed)
  - Default “main” phase
  - Supports static or dynamic (e.g., per-iteration) phases

# Performance Evaluation Alternatives

---

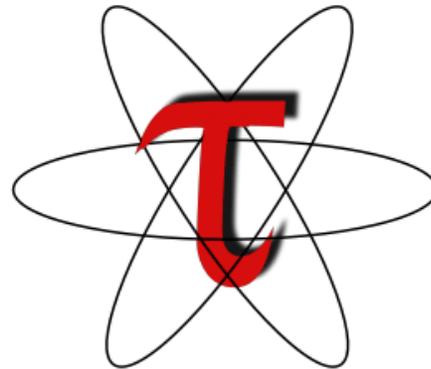

Each alternative has:  
- one metric/counter  
- multiple counters

—————→  
Volume of performance data

# TAU: A Quick Reference

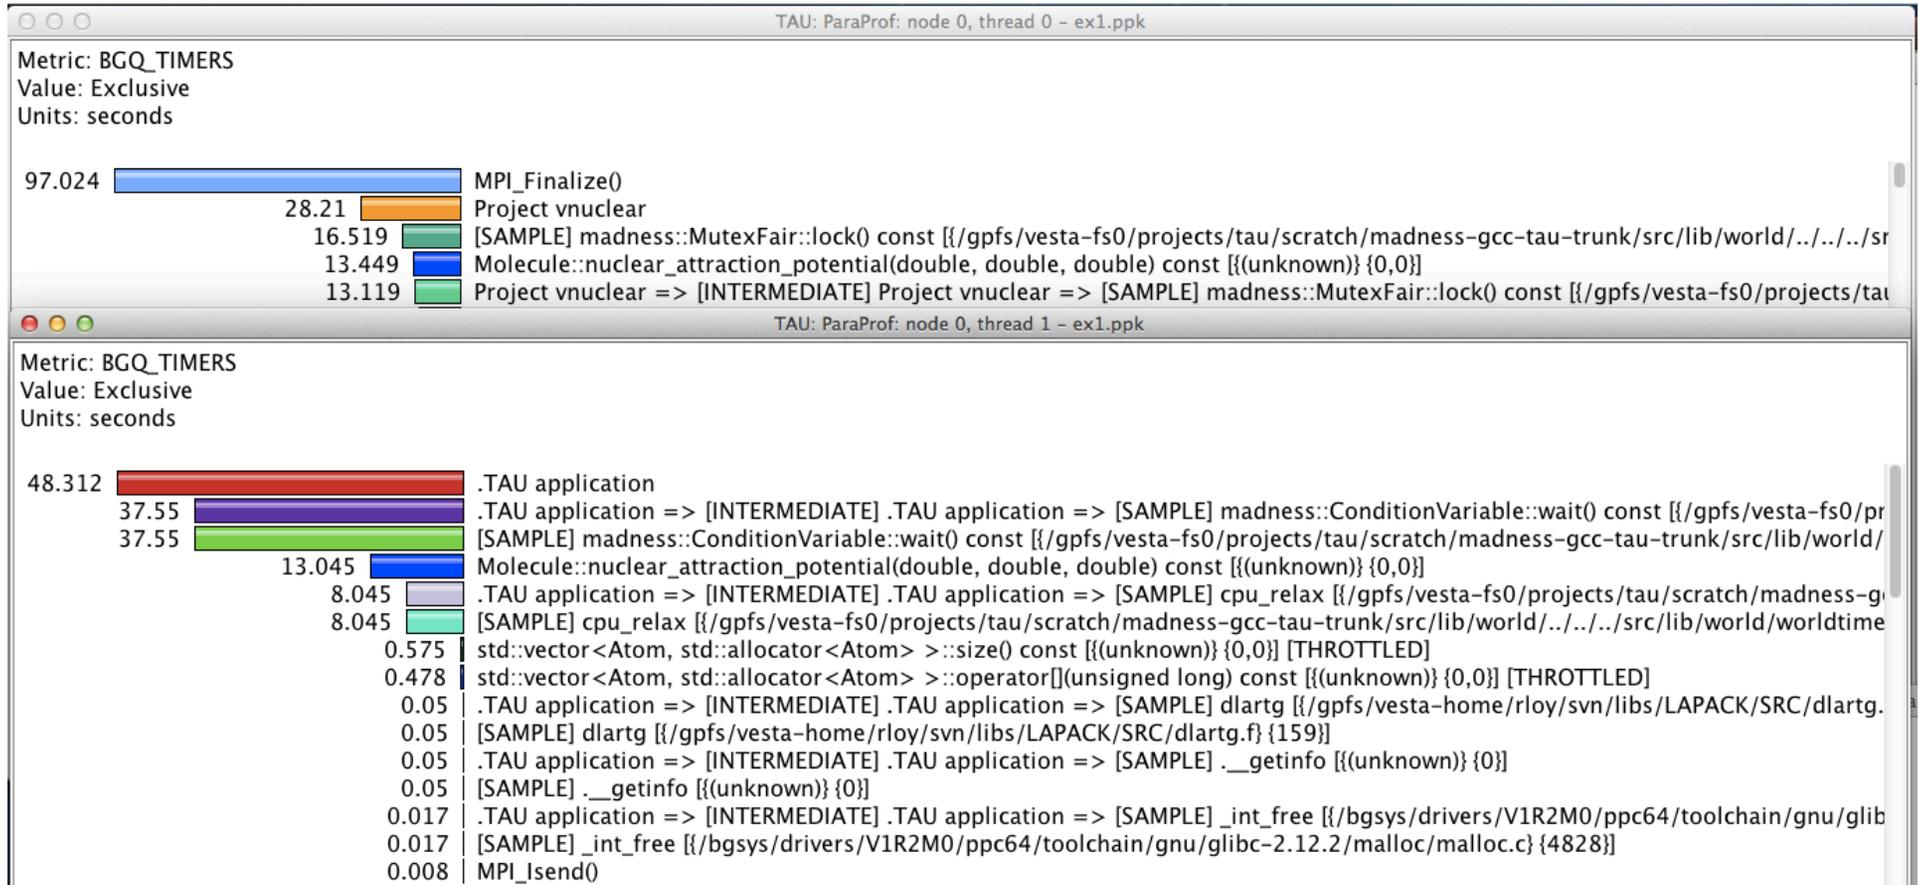

---

# Runtime Environment Variables (tau.conf)

Environment Variable	Default	Description
TAU_TRACE	0	Setting to 1 turns on tracing
TAU_CALLPATH	0	Setting to 1 turns on callpath profiling
TAU_TRACK_MEMORY_LEAKS	0	Setting to 1 turns on leak detection
TAU_TRACK_HEAP or TAU_TRACK_HEADROOM	0	Setting to 1 turns on tracking heap memory/headroom at routine entry & exit using context events (e.g., Heap at Entry: main=>foo=>bar)
TAU_CALLPATH_DEPTH	2	Specifies depth of callpath. Setting to 0 generates no callpath or routine information, setting to 1 generates flat profile and context events have just parent information (e.g., Heap Entry: foo)
TAU_TRACK_SIGNALS	0	Setting to 1 generate debugging callstack info when a program crashes
TAU_SAMPLING	0	Setting to 1 generates sample based profiles
TAU_COMM_MATRIX	0	Setting to 1 generates communication matrix display using context events
TAU_THROTTLE	1	Setting to 0 turns off throttling. Enabled by default to remove instrumentation in lightweight routines that are called frequently
TAU_THROTTLE_NUMCALLS	100000	Specifies the number of calls before testing for throttling
TAU_THROTTLE_PERCALL	10	Specifies value in microseconds. Throttle a routine if it is called over 100000 times and takes less than 10 usec of inclusive time per call
TAU_COMPENSATE	0	Setting to 1 enables runtime compensation of instrumentation overhead
TAU_PROFILE_FORMAT	Profile	Setting to "merged" generates a single file - tauprofile.xml. "snapshot" generates xml format
TAU_METRICS	TIME	Setting to a comma separated list generates other metrics. (e.g., --env TIME:BGQ_TIMERS:PAPI_FP_INS:PAPI_NATIVE_<event>)

# EBS: Setting TAU\_SAMPLING=1

**% export PATH=/soft/perftools/tau/tau\_latest/bgq/bin/compilers:\$PATH**  
**No need to set any other TAU variables! Use tau.conf for settings.**

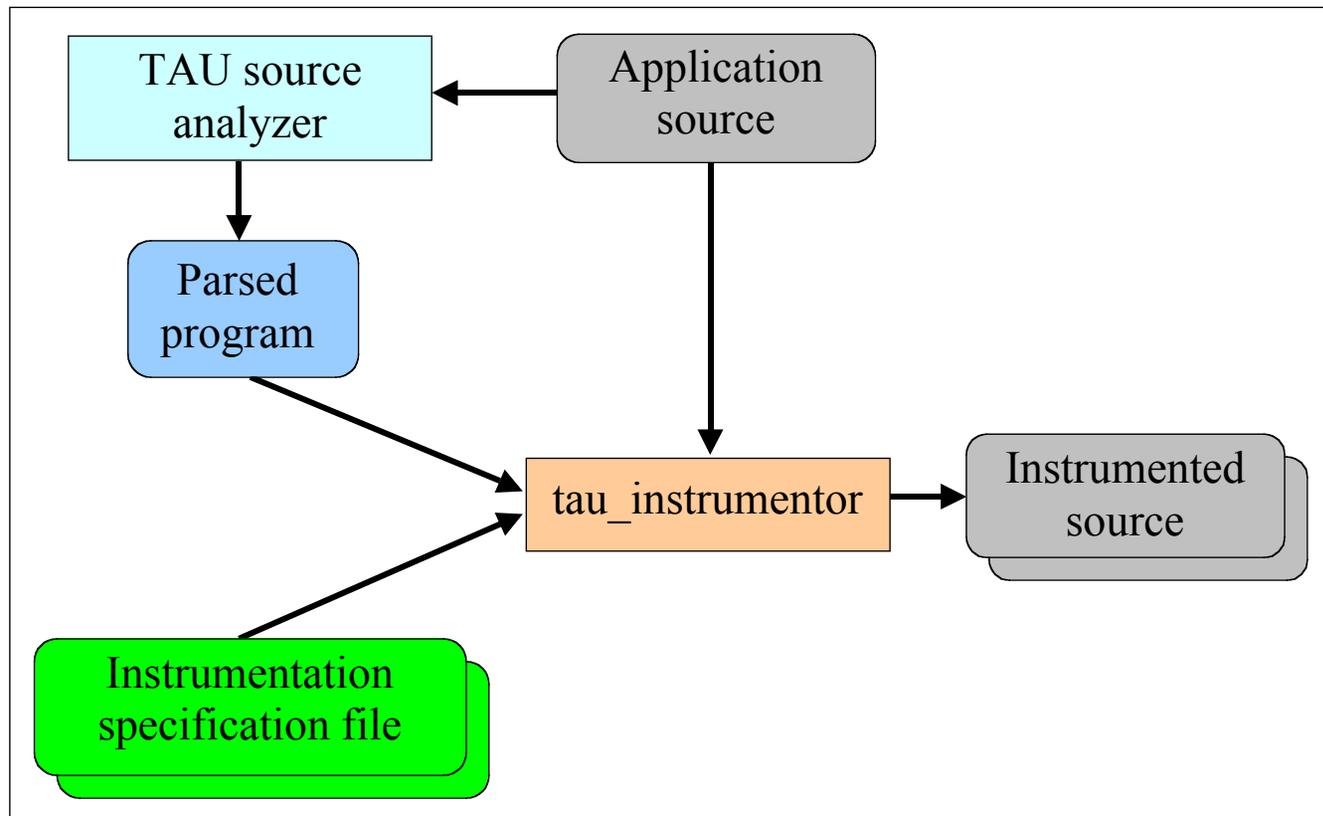

**ParaTools**

# TAU's Manual Instrumentation API

---

# Automatic Source-Level Instrumentation in TAU using Program Database Toolkit (PDT)

# Automatic Instrumentation

---

# TAU\_COMPILER Commandline Options

---

# Compile-Time Environment Variables

- Optional parameters for TAU\_OPTIONS: [tau\_compiler.sh -help]
  - optVerbose Turn on verbose debugging messages
  - optComplnst Use compiler based instrumentation
  - optNoComplnst Do not revert to compiler instrumentation if source instrumentation fails.
  - optLinkOnly Do not instrument the source code. Simply link in the TAU libraries
  - optTrackIO Wrap POSIX I/O call and calculates vol/bw of I/O operations (Requires TAU to be configured with -iowrapper)
  - optKeepFiles Does not remove intermediate .pdb and .inst.\* files
  - optPreProcess Preprocess Fortran sources before instrumentation
  - optTauSelectFile="" Specify selective instrumentation file for tau\_instrumentor
  - optTauWrapFile="" Specify link\_options.tau generated by tau\_gen\_wrapper
  - optLinking="" Options passed to the linker. Typically \$(TAU\_MPI\_FLIBS) \$(TAU\_LIBS) \$(TAU\_CXXLIBS)
  - optCompile="" Options passed to the compiler. Typically \$(TAU\_MPI\_INCLUDE) \$(TAU\_INCLUDE) \$(TAU\_DEFS)
  - optPdtF95Opts="" Add options for Fortran parser in PDT (f95parse/gfparse)
  - optPdtF95Reset="" Reset options for Fortran parser in PDT (f95parse/gfparse)
  - optPdtCOpts="" Options for C parser in PDT (cparse). Typically \$(TAU\_MPI\_INCLUDE) \$(TAU\_INCLUDE) \$(TAU\_DEFS)
  - optPdtCxxOpts="" Options for C++ parser in PDT (cxxparse). Typically \$(TAU\_MPI\_INCLUDE) \$(TAU\_INCLUDE) \$(TAU\_DEFS)

# Compiling Fortran Codes with TAU

---

- If your Fortran code uses free format in .f files (fixed is default for .f), you may use:  
`% export TAU_OPTIONS= '-optPdtF95Opts="-R free" -optVerbose '`
- To use the compiler based instrumentation instead of PDT (source-based):  
`% export TAU_OPTIONS= '-optComplnst -optVerbose'`
- If your Fortran code uses C preprocessor directives (`#include`, `#ifdef`, `#endif`):  
`% export TAU_OPTIONS= '-optPreProcess -optVerbose -optDetectMemoryLeaks'`
- To use an instrumentation specification file:  
`% export TAU_OPTIONS= '-optTauSelectFile=mycmd.tau -optVerbose -optPreProcess'`  
`% cat mycmd.tau`  
`BEGIN_INSTRUMENT_SECTION`  
`memory file="foo.f90" routine="#"`  
`# instruments all allocate/deallocate statements in all routines in foo.f90`  
`loops file="*" routine="#"`  
`io file="abc.f90" routine="FOO"`  
`END_INSTRUMENT_SECTION`

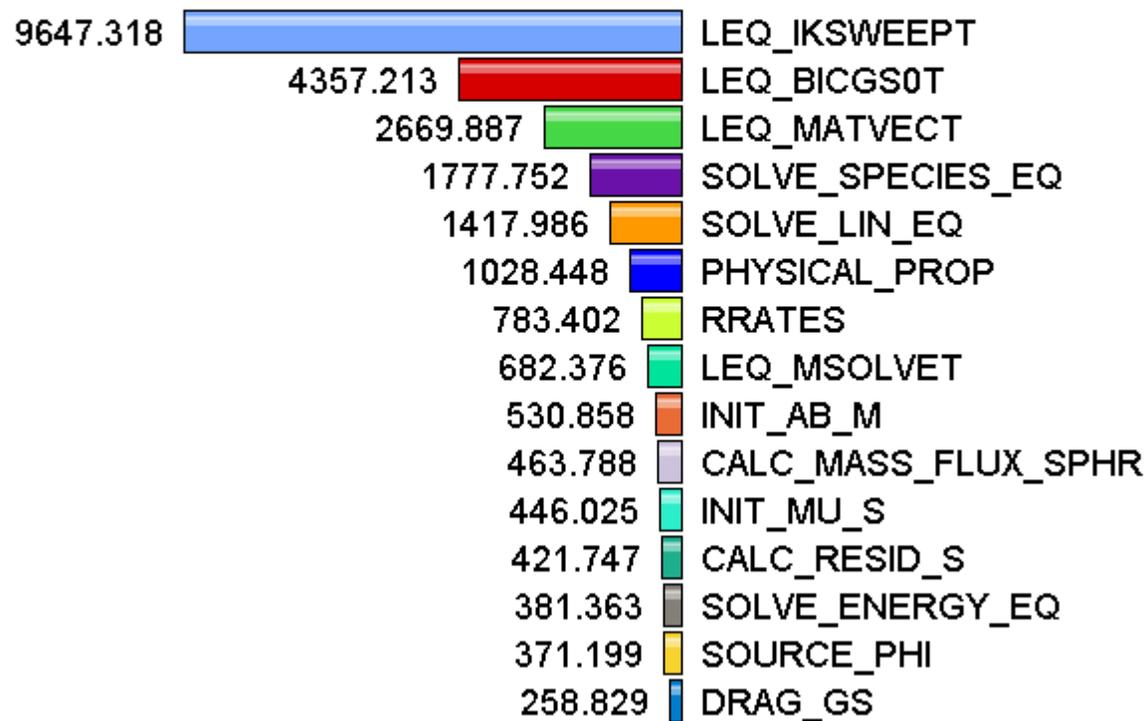

# Steps of Performance Evaluation

---

- Collect basic routine-level timing profile to determine where most time is being spent
- Collect routine-level hardware counter data to determine types of performance problems
- Collect callpath profiles to determine sequence of events causing performance problems
- Conduct finer-grained profiling and/or tracing to pinpoint performance bottlenecks
  - Loop-level profiling with hardware counters
  - Tracing of communication operations

# Usage Scenarios: Routine Level Profile

- Goal: What routines account for the most time? How much?
- Flat profile with wallclock time:  
Metric: P\_VIRTUAL\_TIME  
Value: Exclusive  
Units: seconds

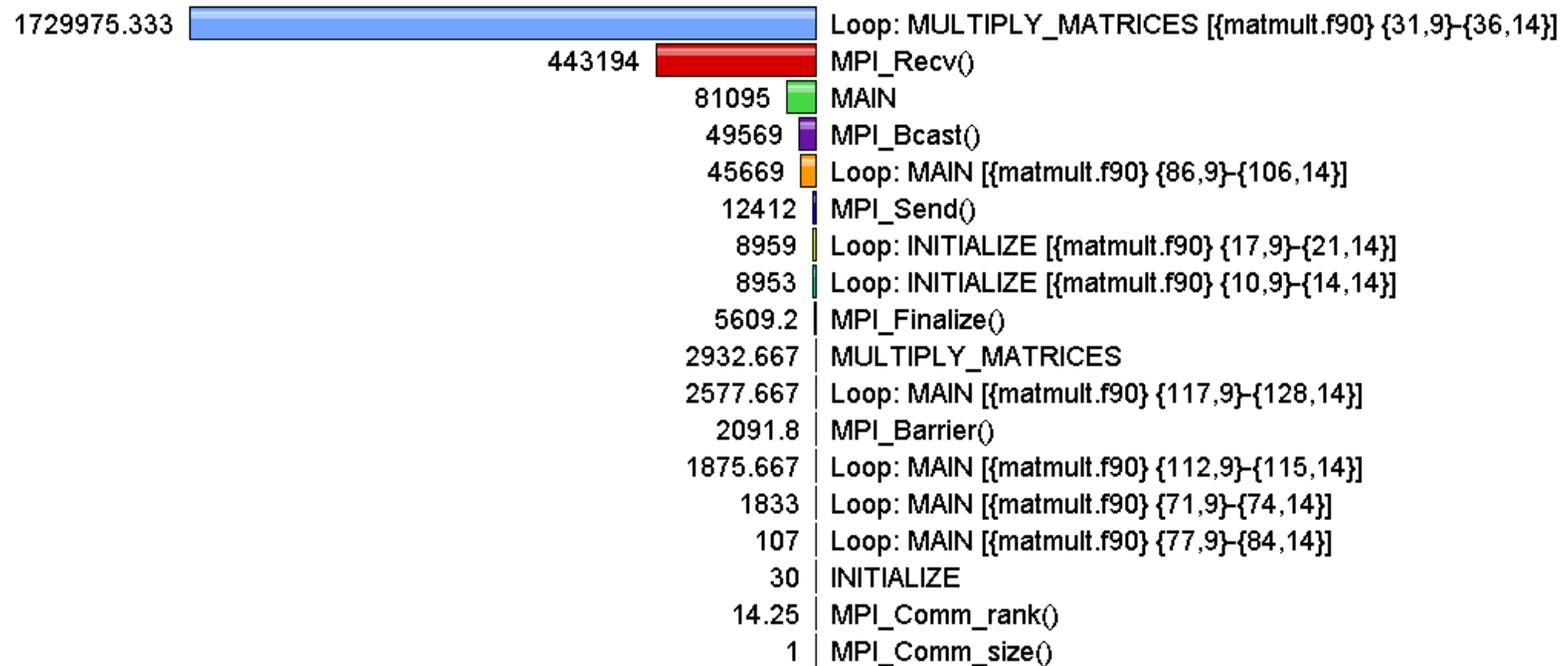

# Solution: Generating a flat profile with MPI

---

# Usage Scenarios: Loop Level Instrumentation

- Goal: What loops account for the most time? How much?
- Flat profile with wallclock time with loop instrumentation:

Metric: GET\_TIME\_OF\_DAY  
Value: Exclusive  
Units: microseconds

Par

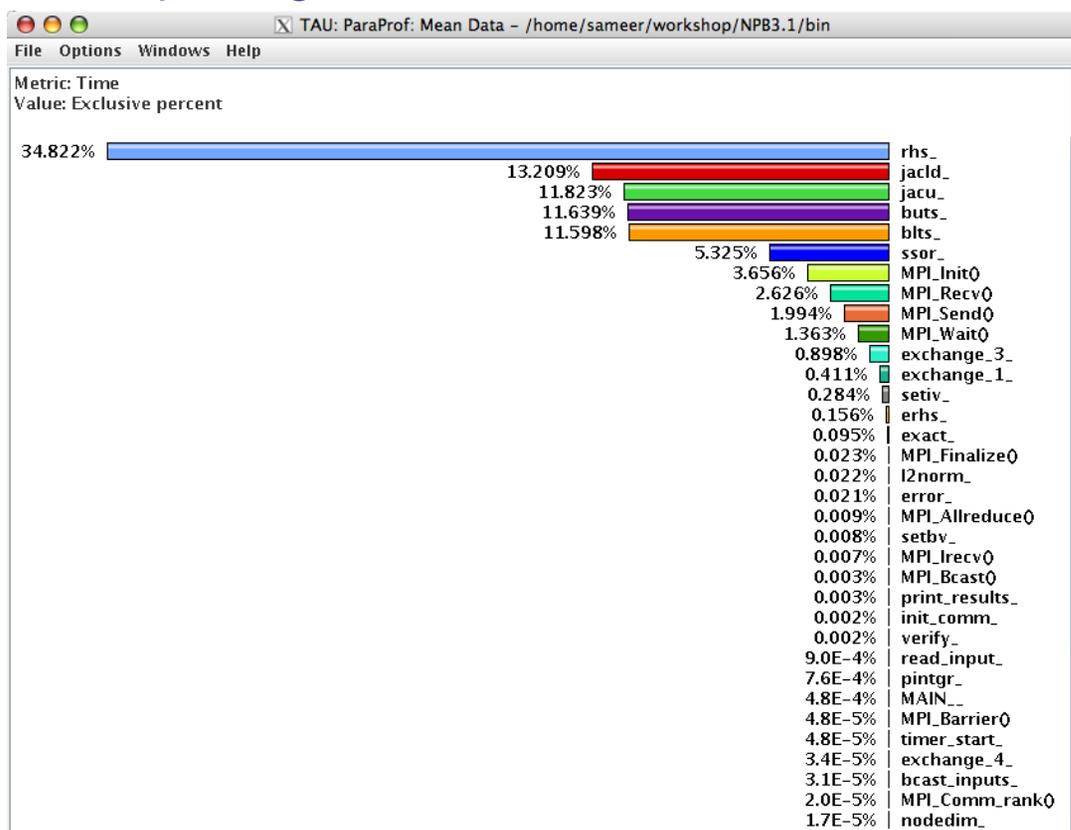

# Solution: Generating a loop level profile

---

# Usage Scenarios: Compiler-based Instrumentation

- Goal: Easily generate routine level performance data using the compiler instead of PDT for parsing the source code

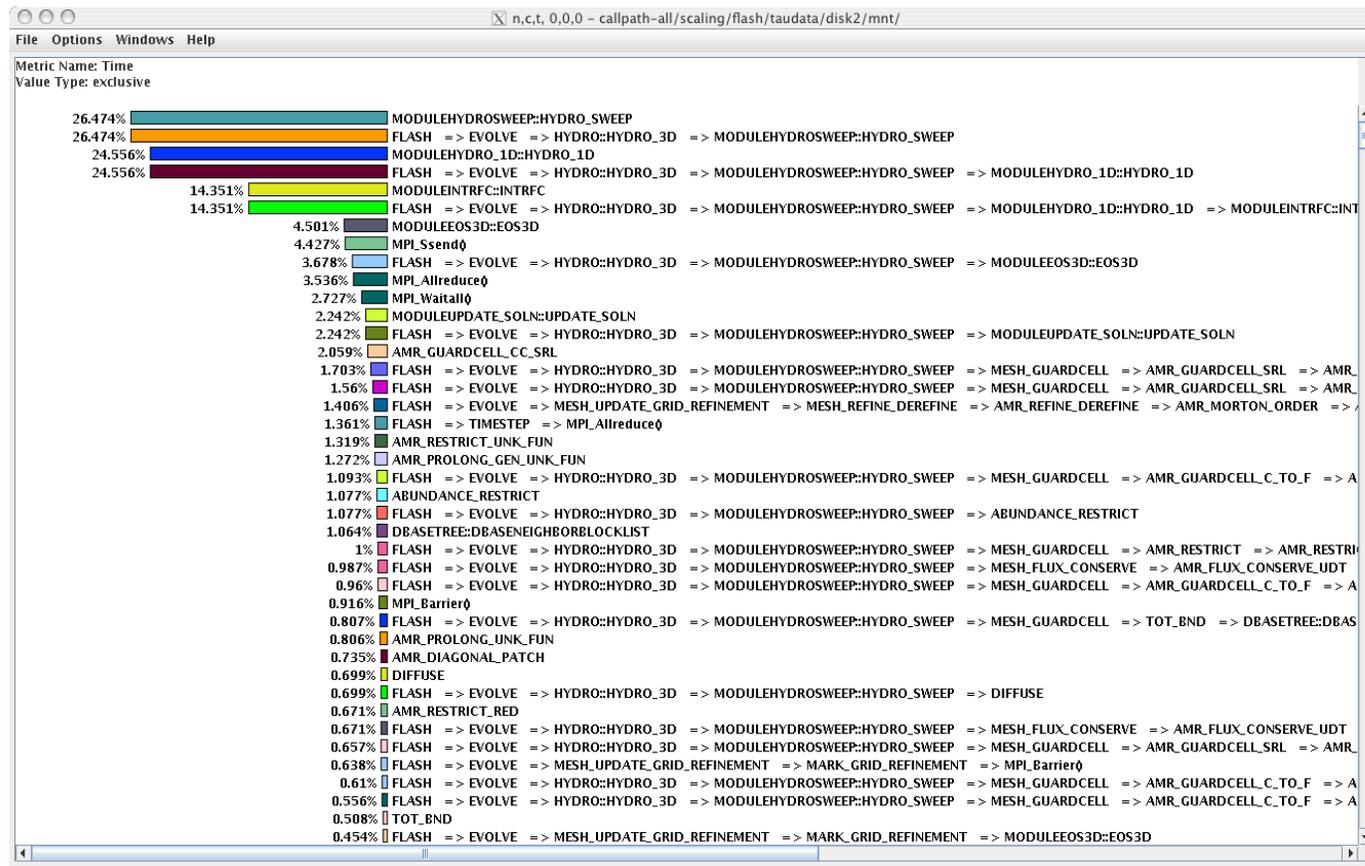

# Use Compiler-Based Instrumentation

---

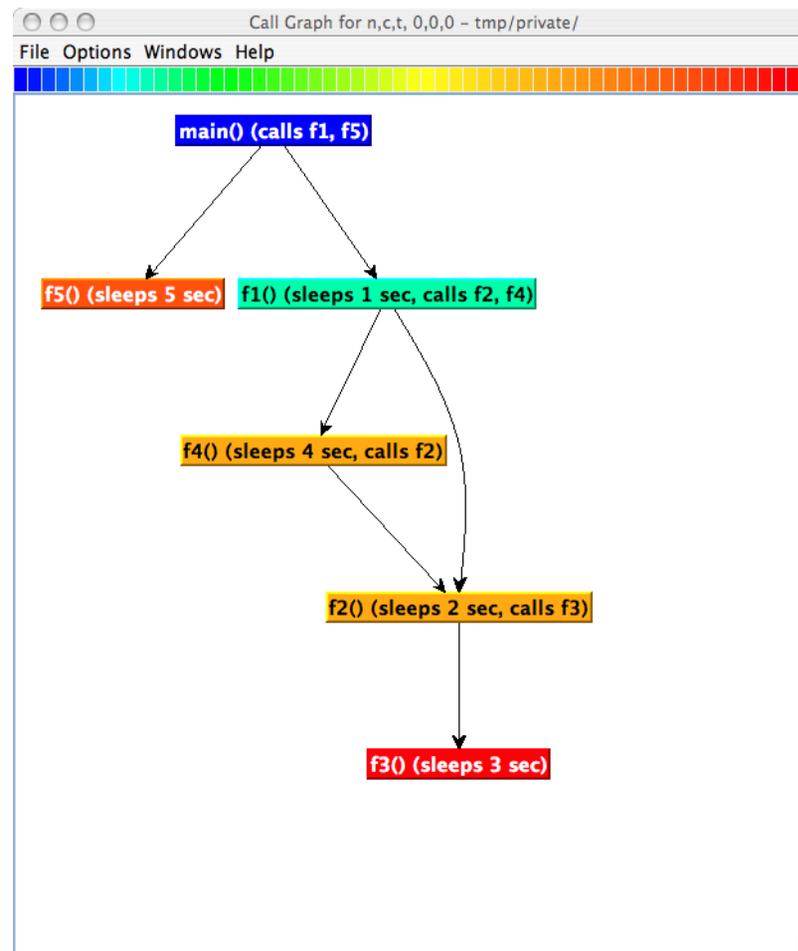

# Usage Scenarios: Generating Callpath Profile

- Goal: Who calls my MPI\_Barrier()? Where?
- Callpath profile for a given callpath depth:

# Callpath Profile

- Generates program callgraph

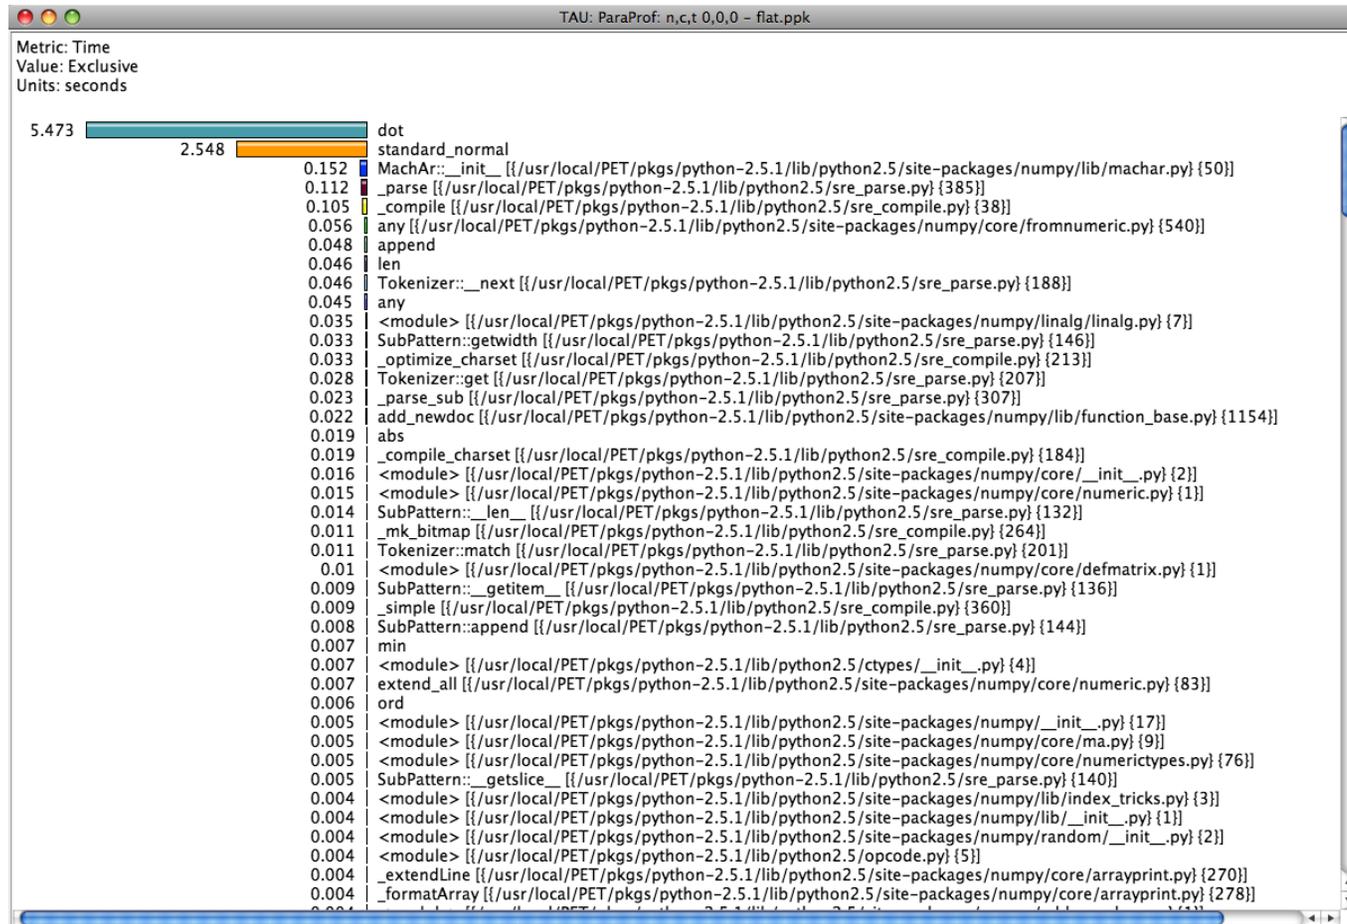

# Generate a Callpath Profile

---

# Usage Scenarios: Instrument a Python program

- Goal: Generate a flat profile for a Python program

# Usage Scenarios: Instrument a Python program

---

*Original  
code:*

```
% cat foo.py
#!/usr/bin/env python
import numpy
ra=numpy.random
la=numpy.linalg

size=2000
a=ra.standard_normal((size,size))
b=ra.standard_normal((size,size))
c=la.linalg.dot(a,b)
print c
```

*Create a wrapper:*

```
% cat wrapper.py
#!/usr/bin/env python

# setenv PYTHONPATH $PET_HOME/pkgs/tau-2.17.3/ppc64/lib/bindings-gnu-python-pdt

import tau

def OurMain():
    import foo

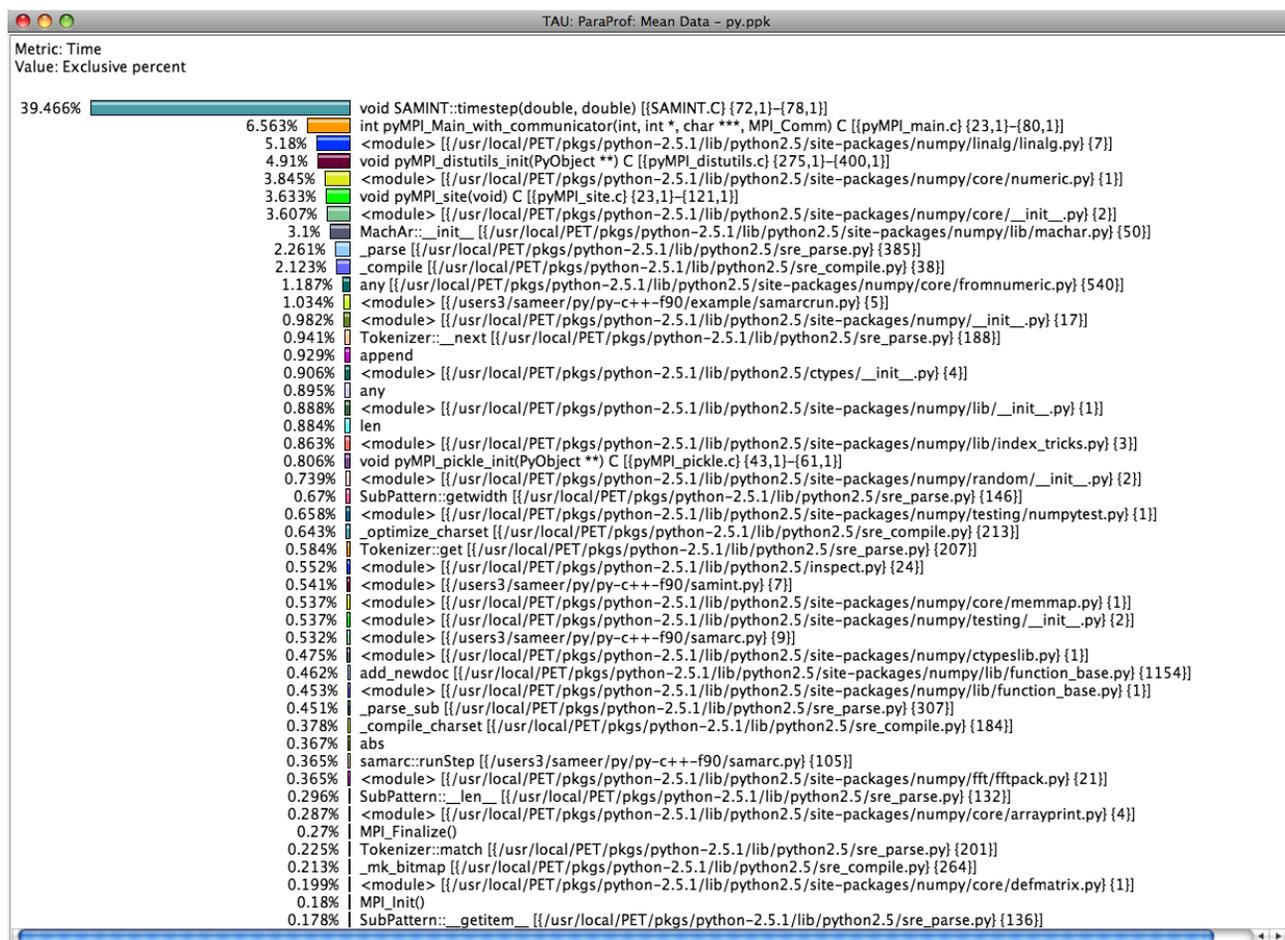

tau.run('OurMain()')
```

# Generate a Python Profile

---

# Usage Scenarios: Mixed Python+F90+C+pyMPI

- Goal: Generate multi-level instrumentation for Python+MPI+C+F90+C++ ...

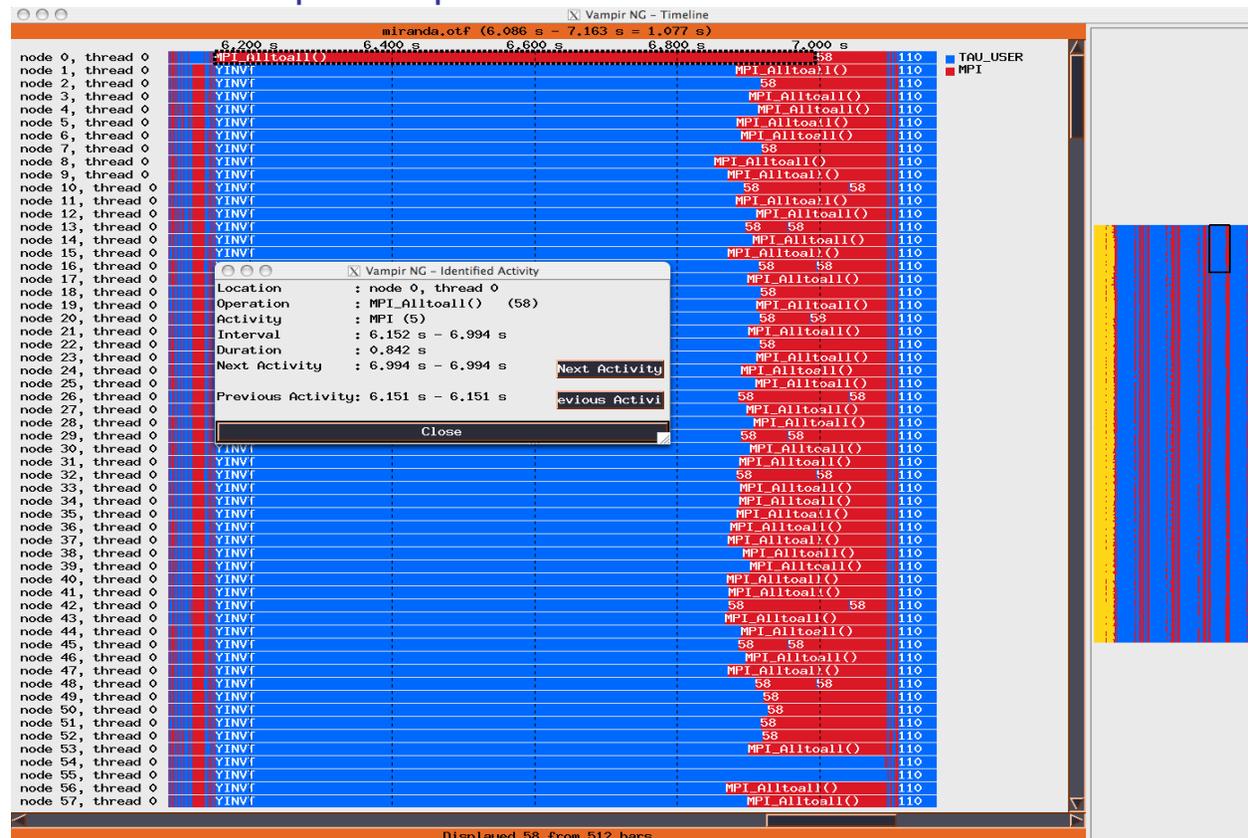

# Generate a Multi-Language Profile w/ Python

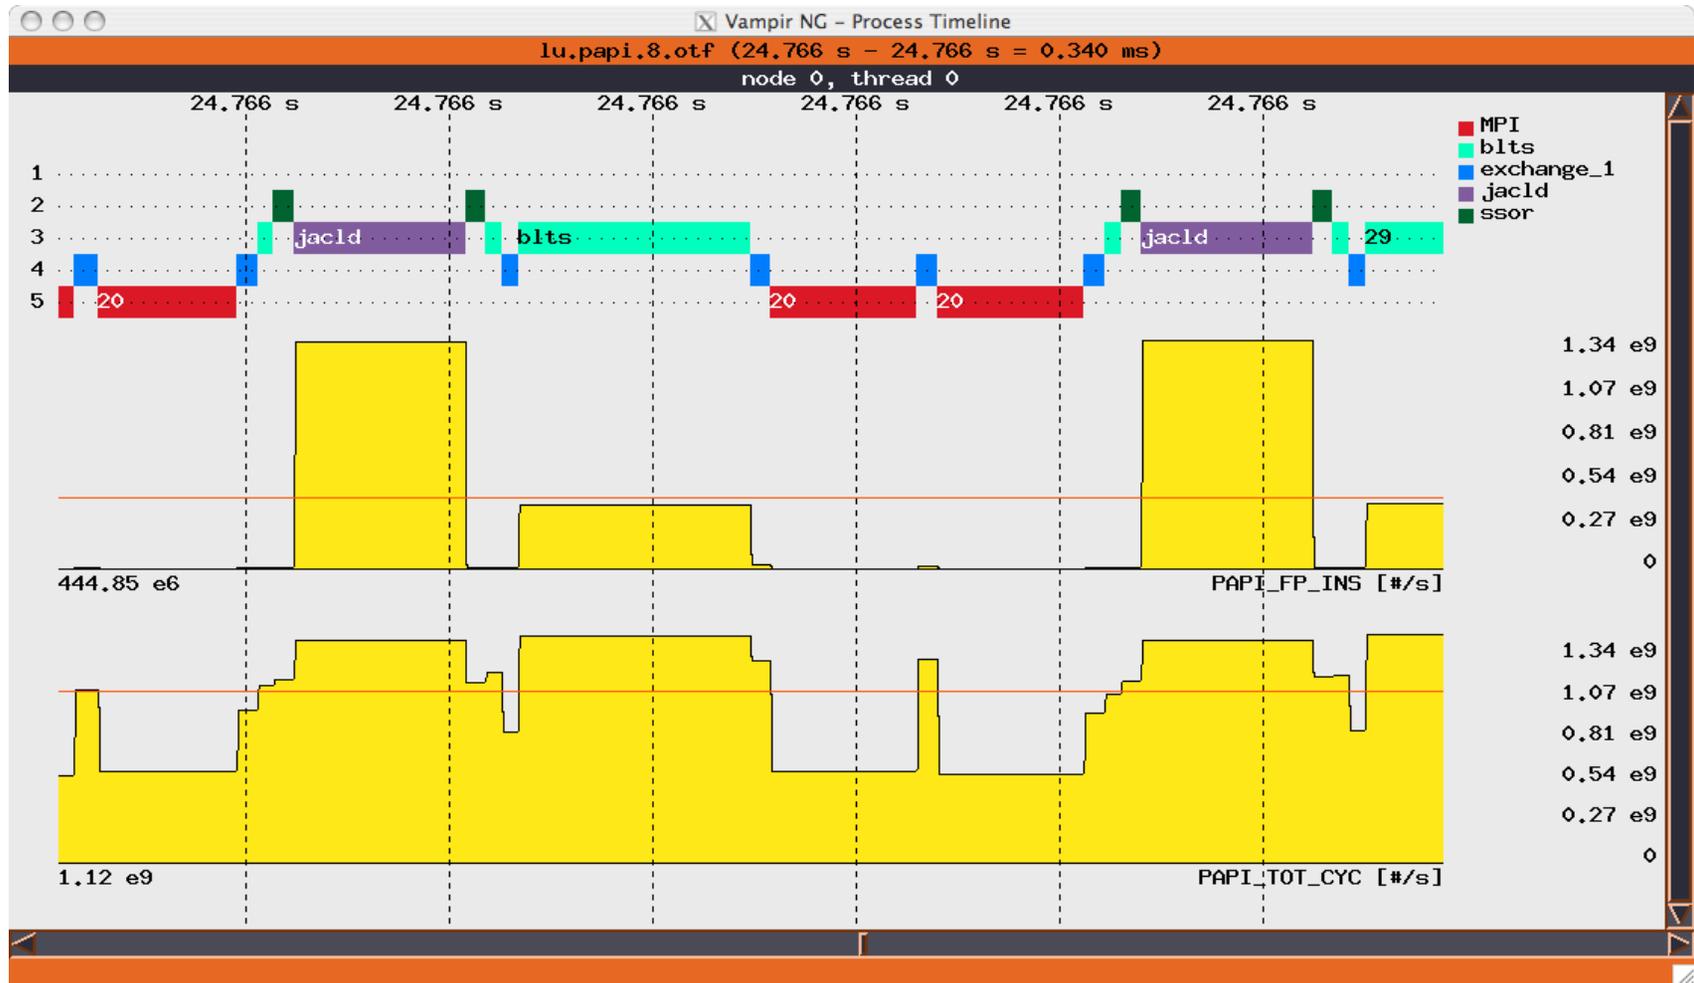

---

# Usage Scenarios: Generating a Trace File

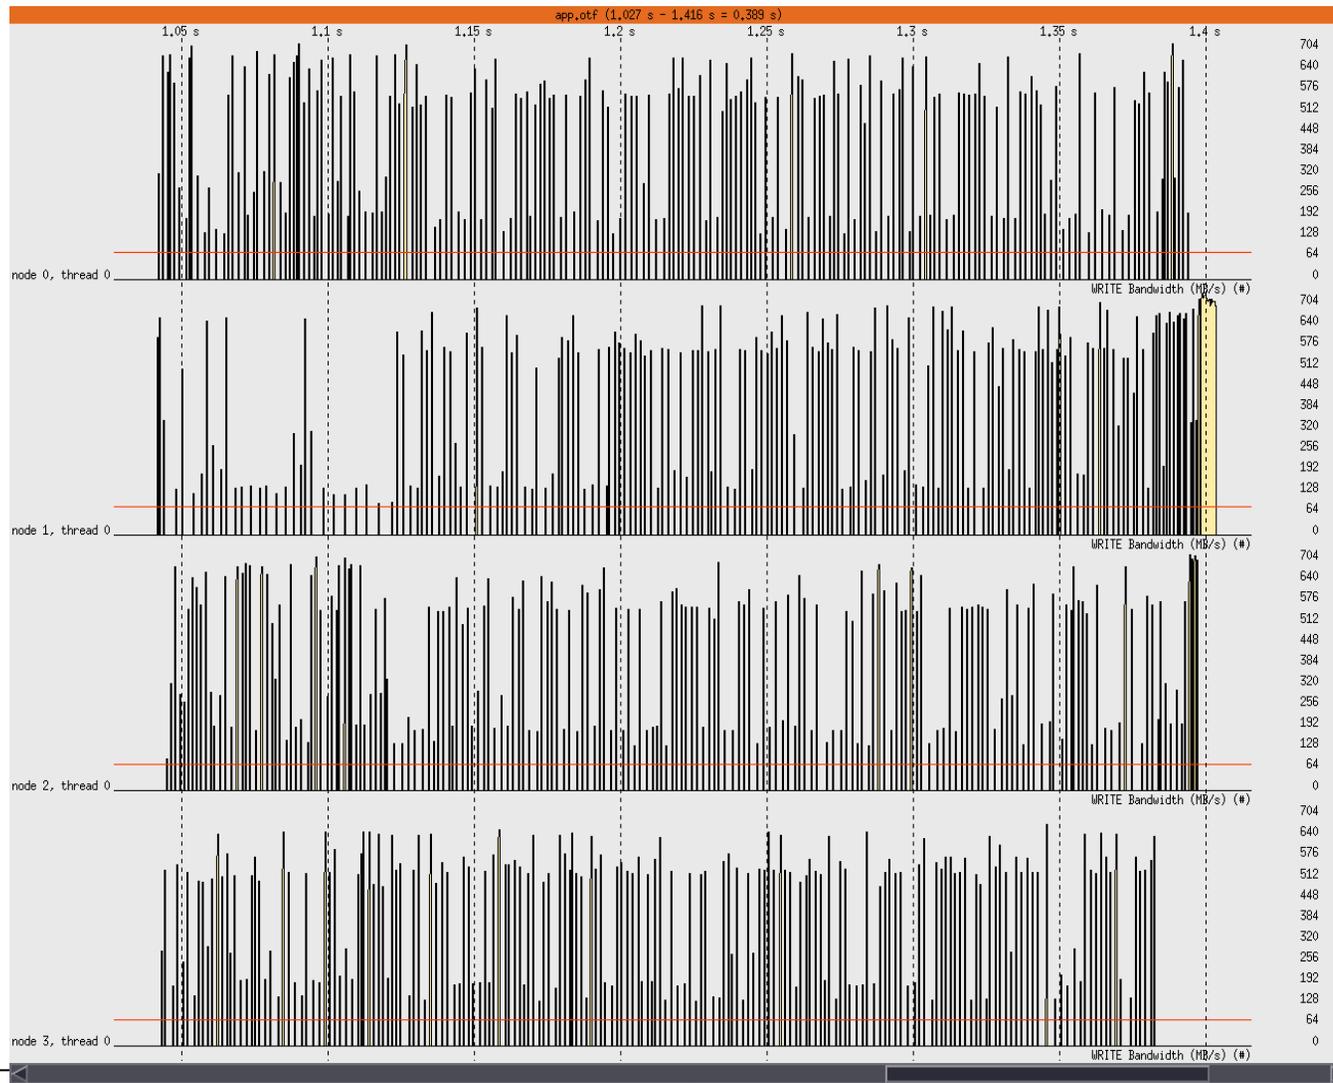

- Goal: Identify the temporal aspect of performance. What happens in my code at a given time? When?
- Event trace visualized in Vampir/Jumpshot

# VNG Process Timeline with PAPI Counters

# Vampir Counter Timeline Showing I/O BW

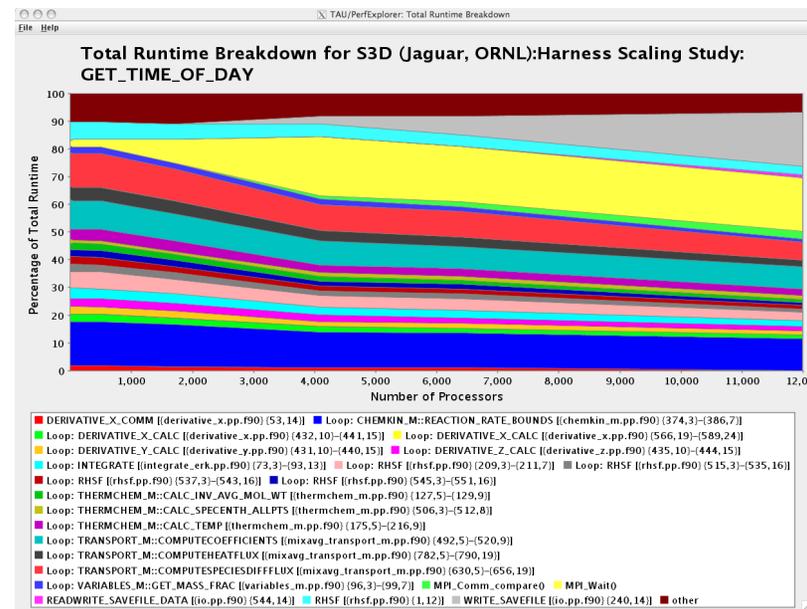

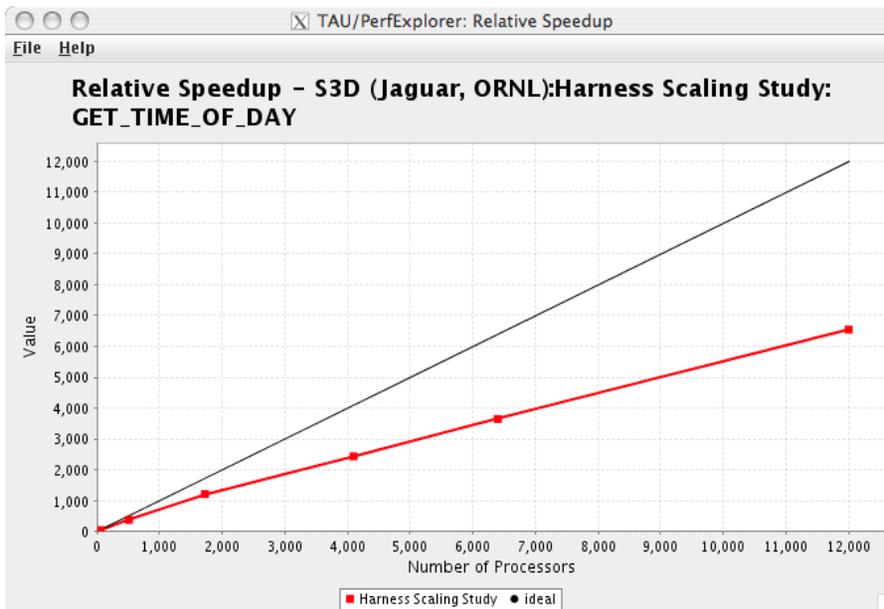

# Generate a Trace File

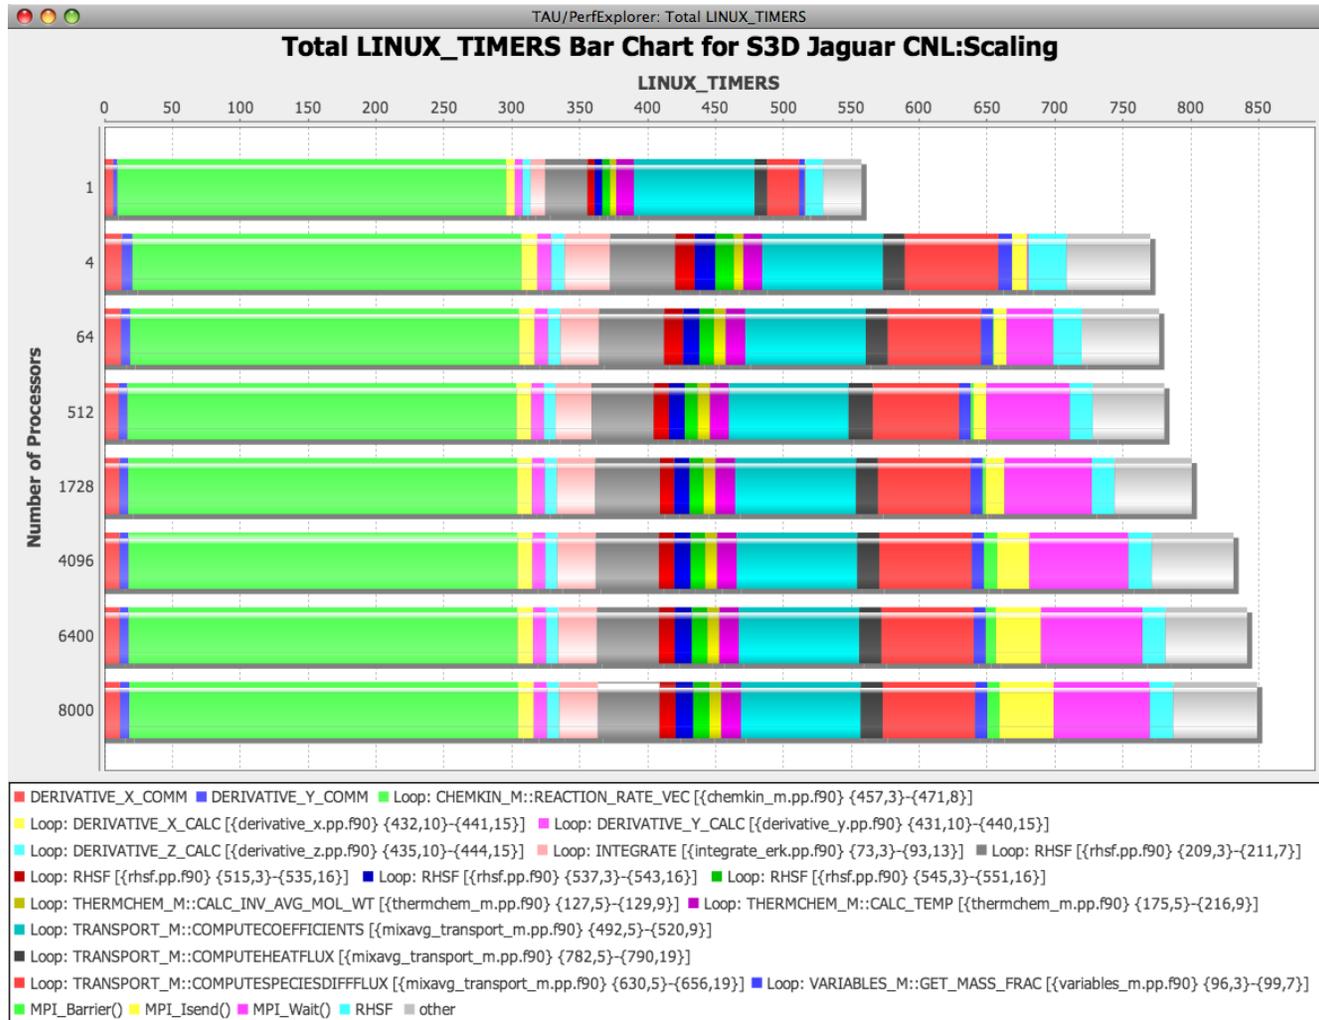

---

# Usage Scenarios: Evaluate Scalability

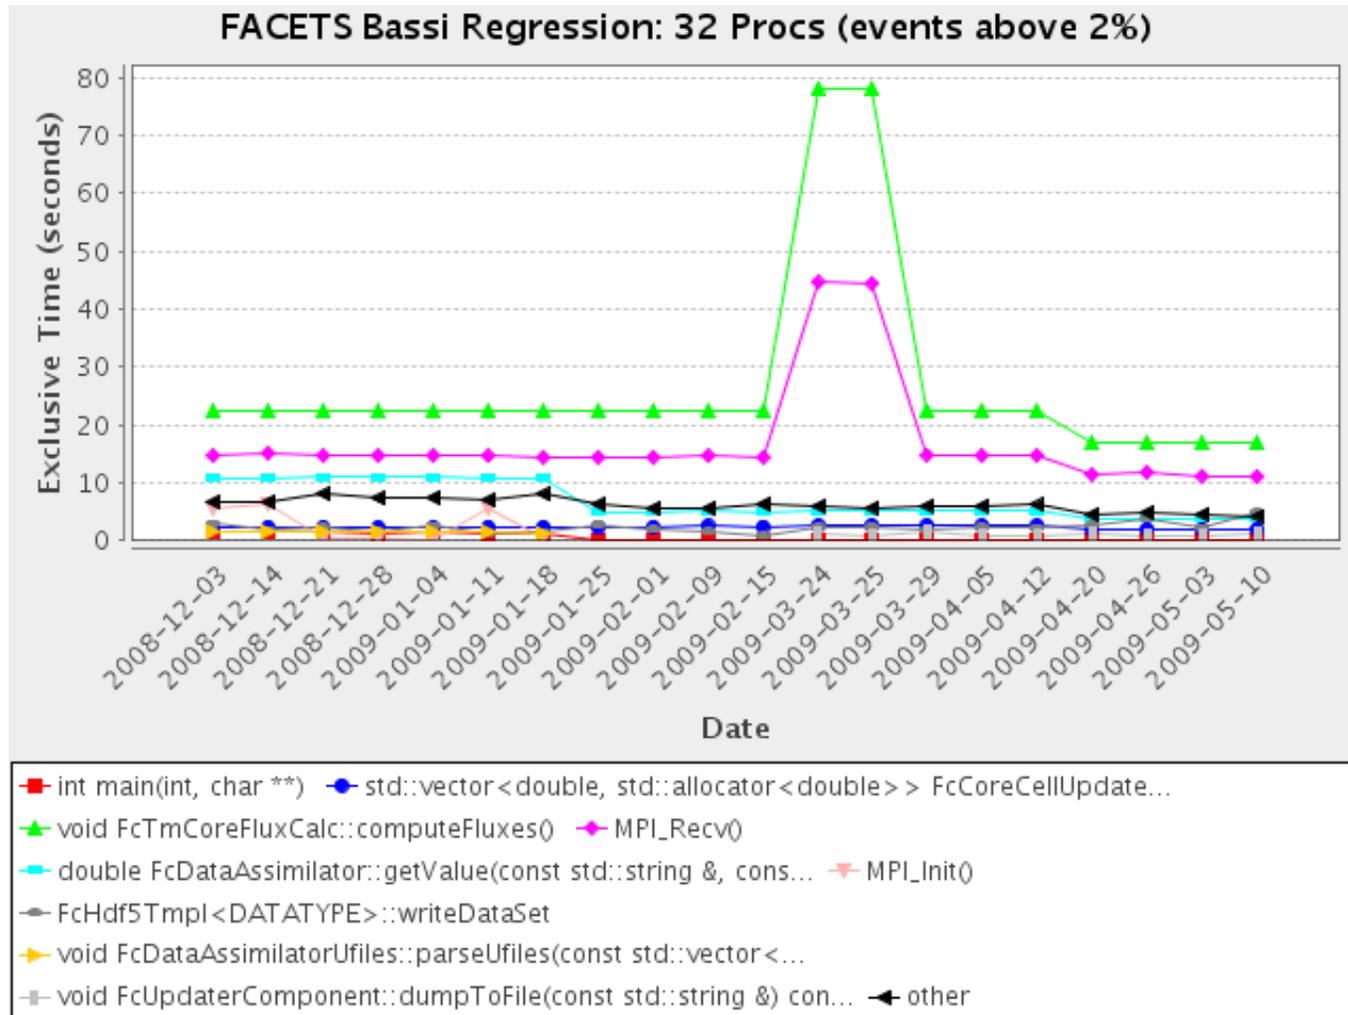

- Goal: How does my application scale? What bottlenecks occur at what core counts?
- Load profiles in PerfDMF database and examine with PerfExplorer

# Usage Scenarios: Evaluate Scalability

# Performance Regression Testing

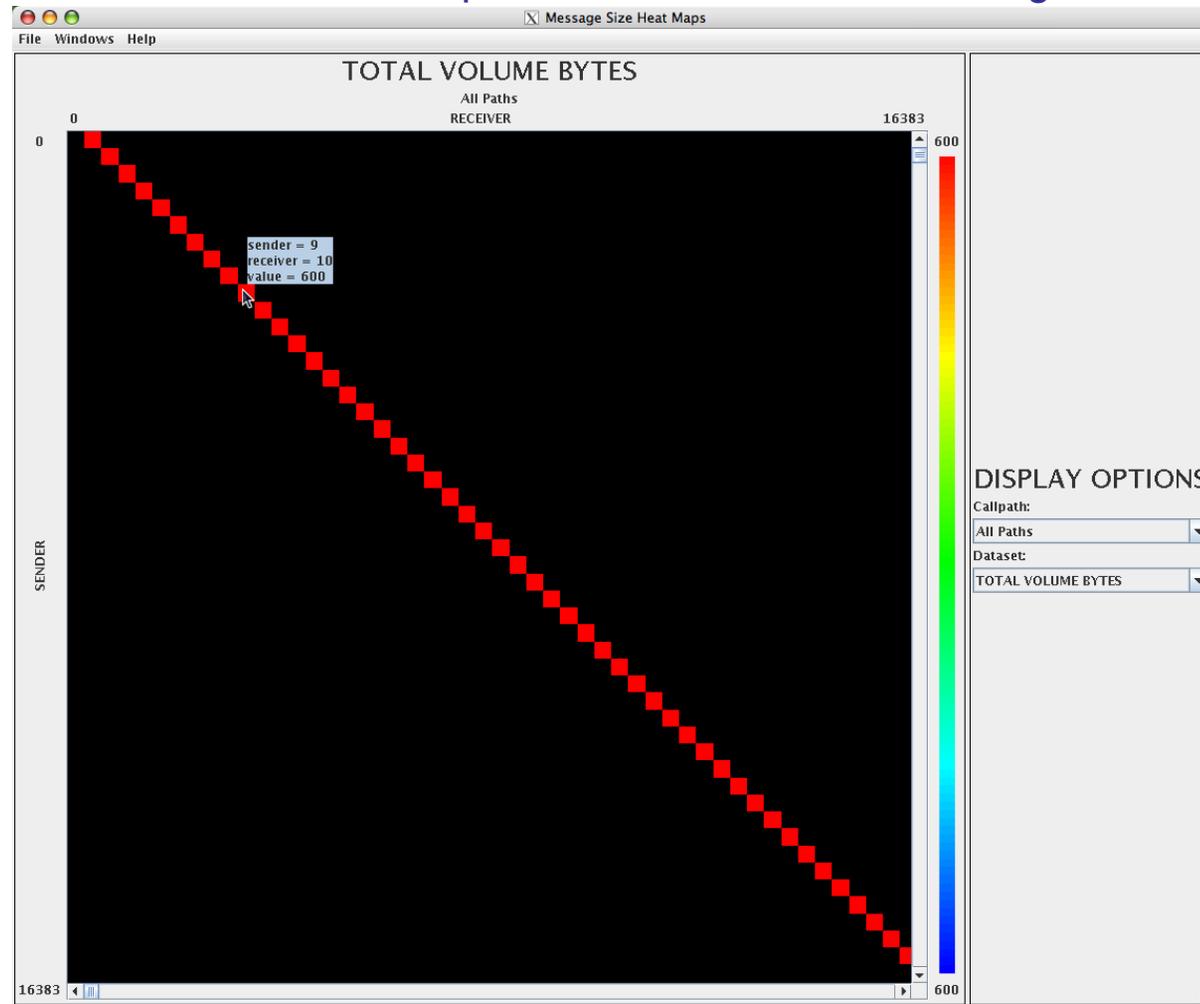

# Evaluate Scalability using PerfExplorer Charts

---

# Communication Matrix Display

- Goal: What is the volume of inter-process communication? Along which calling path?

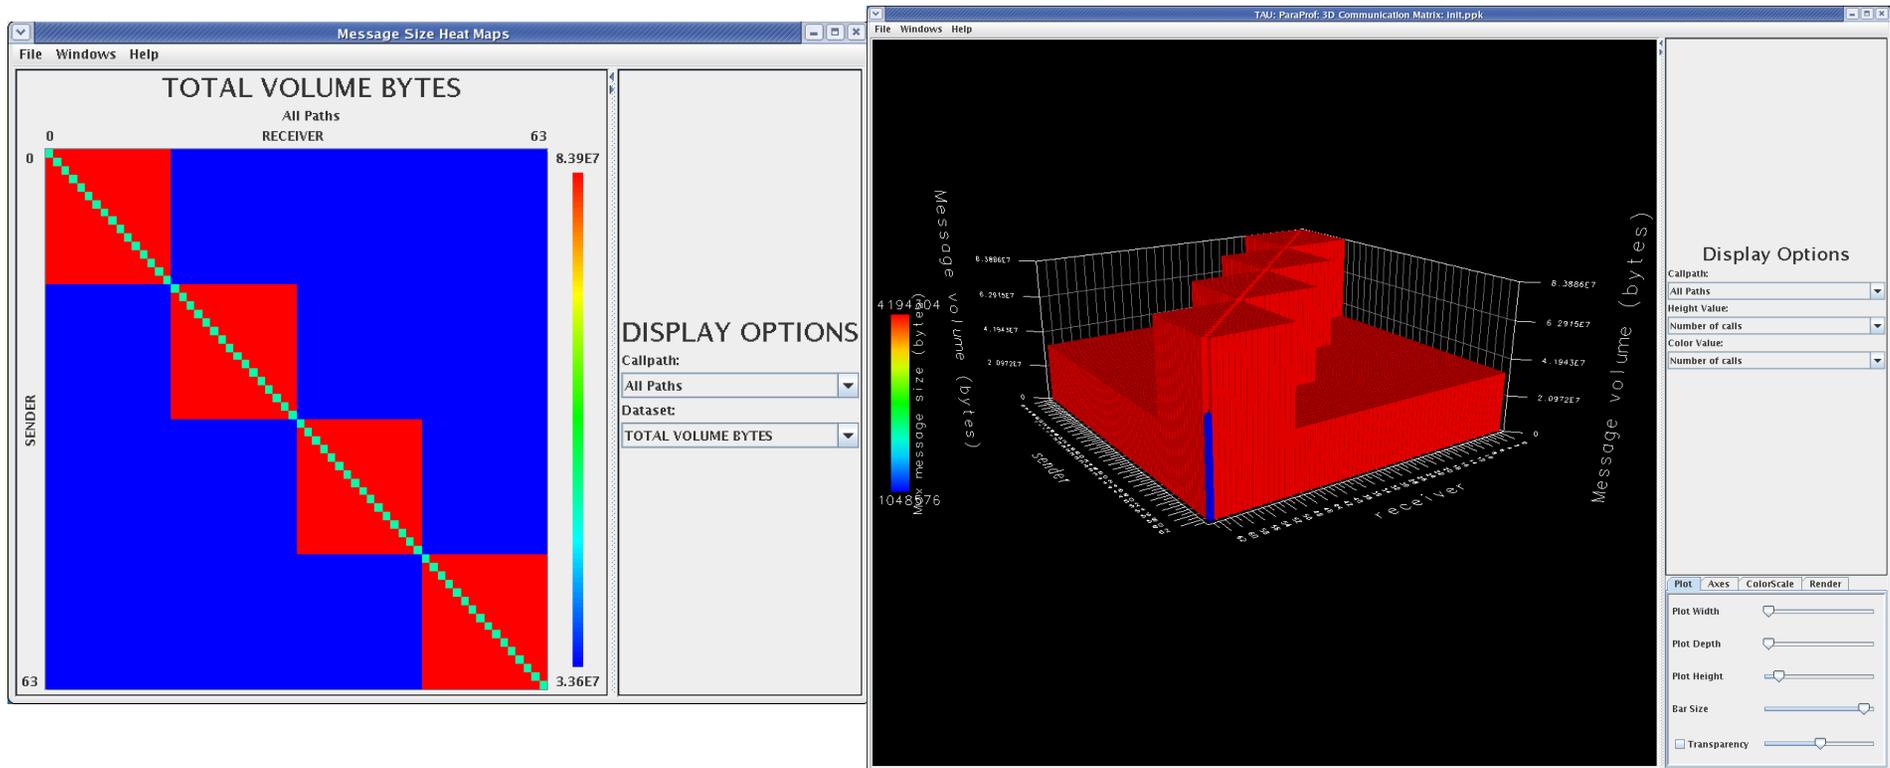

# Evaluate Scalability using PerfExplorer Charts

---

# Communication Matrix Display

- Goal: What is the volume of inter-process communication? Along which calling path?

# Using PAPI and TAU

# Hardware Counters

---

Hardware performance counters available on most modern microprocessors can provide insight into:

1. Whole program timing
2. Cache behaviors
3. Branch behaviors
4. Memory and resource access patterns
5. Pipeline stalls
6. Floating point efficiency
7. Instructions per cycle

Hardware counter information can be obtained with:

1. Subroutine or basic block resolution
2. Process or thread attribution

# What's PAPI?

---

- Open Source software from U. Tennessee, Knoxville
- <http://icl.cs.utk.edu/papi>
- Middleware to provide a consistent programming interface for the performance counter hardware found in most major micro-processors.
- Countable events are defined in two ways:
  - Platform-neutral *preset* events
  - Platform-dependent native events
- Presets can be **derived** from multiple *native events*
- All events are referenced by name and collected in EventSets

# Profile Measurement – Three Flavors

---

- **Flat profiles**
  - Time (or counts) spent in each routine (nodes in callgraph).
  - Exclusive/inclusive time, no. of calls, child calls
  - E.g.,: MPI\_Send, foo, ...
- **Callpath Profiles**
  - Flat profiles, **plus**
  - Sequence of actions that led to poor performance
  - Time spent along a calling path (edges in callgraph)
  - E.g., “main=> f1 => f2 => MPI\_Send” shows the time spent in MPI\_Send when called by f2, when f2 is called by f1, when it is called by main. Depth of this callpath = 4 (TAU\_CALLPATH\_DEPTH environment variable)
- **Phase based profiles**
  - Flat profiles, **plus**
  - Flat profiles under a phase (nested phases are allowed)
  - Default “main” phase has all phases and routines invoked outside phases
  - Supports static or dynamic (per-iteration) phases
  - E.g., “IO => MPI\_Send” is time spent in MPI\_Send in IO phase

# Phase Profiling (NAS BT, Flat Profile)

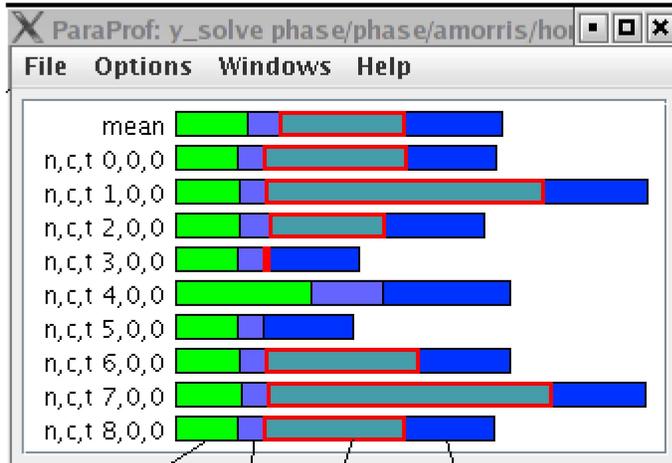

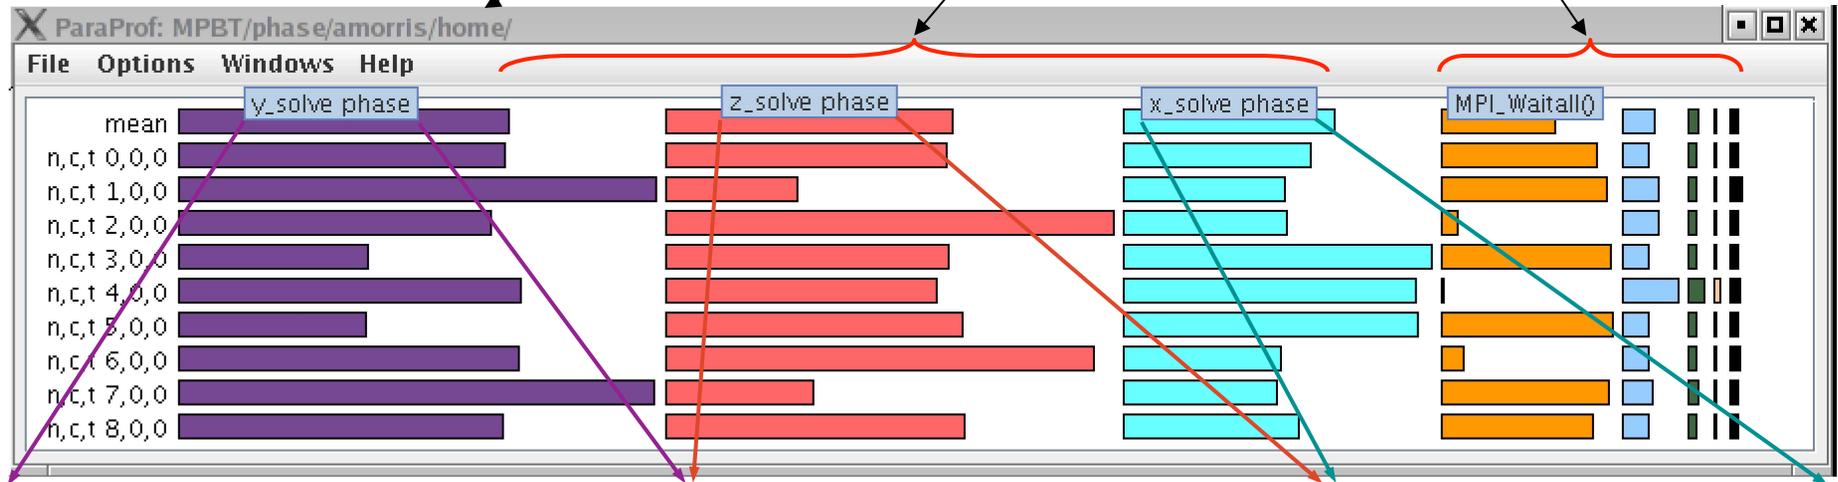

Application routine names reflect phase semantics

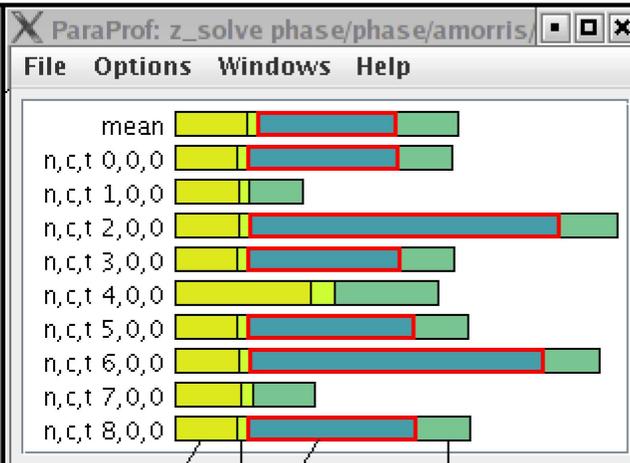

How is MPI\_Wait() distributed relative to solver direction?

# NAS BT – Phase Profile (Main and X, Y, Z)

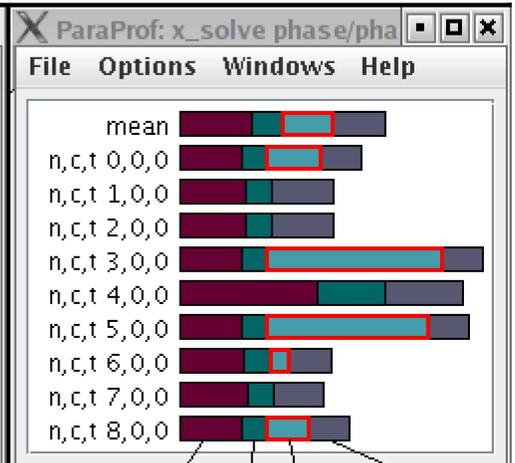

Main phase shows nested phases and immediate events

Y\_SOLVE\_CELL  
MPI\_Wait()  
LHSY  
Y\_BACKSUBSTITUTE

Z\_SOLVE\_CELL  
MPI\_Wait()  
LHSZ  
Z\_BACKSUBSTITUTE

X\_SOLVE\_CELL  
MPI\_Wait()  
LHSX  
X\_BACKSUBSTITUTE

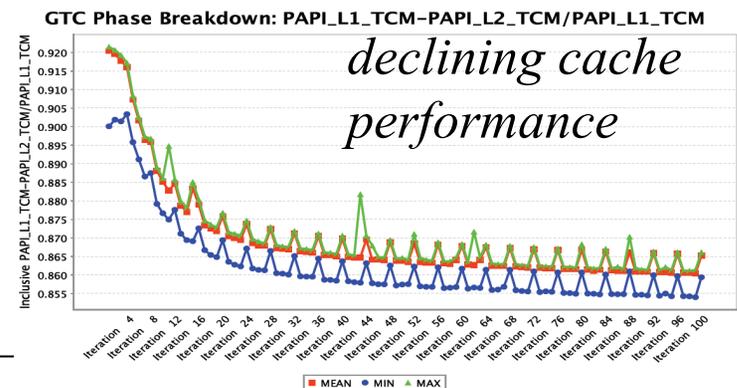

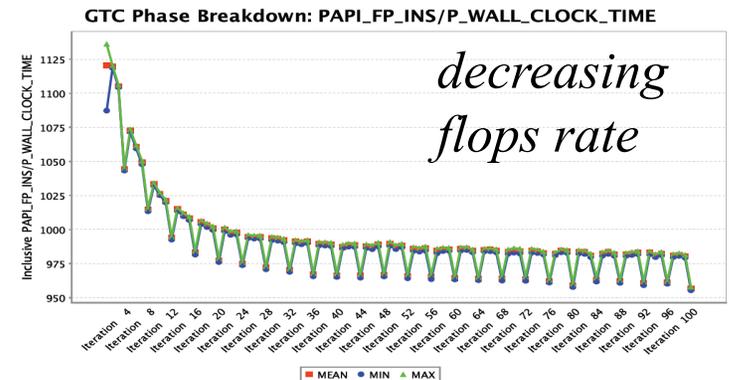

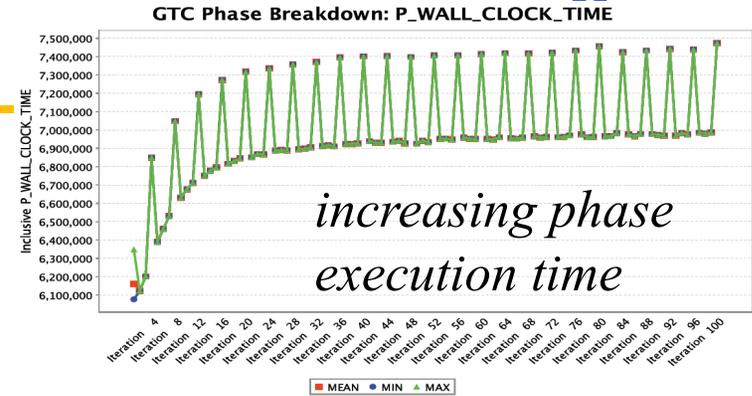

# TAU Timers and Phases

---

- **Static timer**
  - Shows time spent in all invocations of a routine (foo)
  - E.g., “foo()” 100 secs, 100 calls
- **Dynamic timer**
  - Shows time spent in each invocation of a routine
  - E.g., “foo() 3” 4.5 secs, “foo 10” 2 secs (invocations 3 and 10 respectively)
- **Static phase**
  - Shows time spent in all routines called (directly/indirectly) by a given routine (foo)
  - E.g., “foo() => MPI\_Send()” 100 secs, 10 calls shows that a total of 100 secs were spent in MPI\_Send() when it was called by foo.
- **Dynamic phase**
  - Shows time spent in all routines called by a given invocation of a routine.
  - E.g., “foo() 4 => MPI\_Send()” 12 secs, shows that 12 secs were spent in MPI\_Send when it was called by the 4<sup>th</sup> invocation of foo.

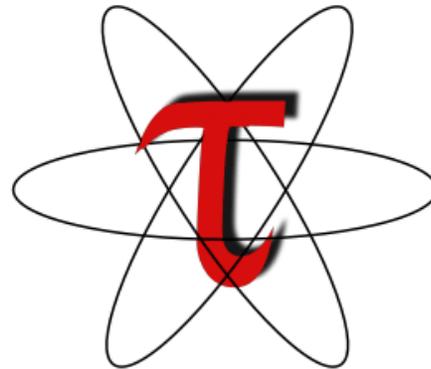

# Performance Dynamics: Phase-Based Profiling

- Profile phases capture performance with respect to application-defined ‘phases’ of execution
  - Separate full profile produce for each phase
- GTC particle-in-cell simulation of fusion turbulence
- Phases assigned to iterations
- Data change affects cache

---

# Memory and I/O evaluation

## Library interposition/wrapping: `tau_exec`, `tau_wrap`

- TAU provides a wealth of options to measure the performance of an application
- Need to simplify TAU usage to easily evaluate performance properties, including I/O, memory, and communication
- Designed a new tool (*tau\_exec*) that leverages runtime instrumentation by pre-loading measurement libraries
- Works on dynamic executables (default under Linux, not on IBM Blue Gene where we must compile with `-dynamic`)
- Substitutes I/O, MPI, and memory allocation/deallocation routines with instrumented calls
  - Interval events (e.g., time spent in `write()`)
  - Atomic events (e.g., how much memory was allocated)
- Measure I/O and memory usage

# TAU Execution Command (tau\_exec)

---

- Uninstrumented execution (compiled with `-WI,-Bdynamic` on BG/P)
  - `% qsub -n 256 -t 10 ./a.out`
- Track MPI performance (`-T <options>`)
  - `% tau_exec -qsub -T bgqtimers,mpi,pdt -- qsub -n 256 -t 10 ./a.out`
- Track I/O and MPI performance (MPI by default, use `-T serial` for serial )
  - `% tau_exec -io qsub -T bgqtimers,mpi,pdt -- qsub -n 256 -t 10 ./a.out`
- Track memory operations
  - `% tau_exec -memory -env TAU_TRACK_MEMORY_LEAKS=1 qsub -T bgqtimers,mpi,pdt -- qsub -n 256 -t 10 ./a.out`

# Library wrapping: tau\_gen\_wrapper

---

- How to instrument an external library without source?
  - Source may not be available
  - Library may be too cumbersome to build (with instrumentation)
- Build a library wrapper tools
  - Used PDT to parse header files
  - Generate new header files with instrumentation files
  - Three methods to instrument: runtime preloading, linking, redirecting headers to re-define functions
- Application is instrumented
- Add the `-optTauWrapFile=<wrapperdir>/link_options.tau` file to `TAU_OPTIONS` env var while compiling with `tau_cc.sh`, etc.
- Wrapped library
  - Redirects references at routine callsite to a wrapper call
  - Wrapper internally calls the original
  - Wrapper has TAU measurement code

# HDF5 Library Wrapping

```
$ tau_gen_wrapper hdf5.h /usr/lib/libhdf5.a -f select.tau
```

```
Usage : tau_gen_wrapper <header> <library> [-r|-d|-w (default)] [-g groupname] [-i headerfile] [-c|-c++|-fortran] [-f <instr_req_file> ]
```

- instruments using runtime preloading (-r), or -Wl,-wrap linker (-w), redirection of header file to redefine the wrapped routine (-d)
- instrumentation specification file (select.tau)
- -g group may be specified (hdf5)
- tau\_exec loads libhdf5\_wrap.so shared library using -loadlib=<libwrap\_pkg.so>
- creates the wrapper/ directory with linkoptions.tau passed to the TAU\_OPTIONS environment variable using -optTauWrapFile=<file>

```

# A New Approach: tau\_exec

---

- Runtime instrumentation by pre-loading the measurement library
- Works on dynamic executables (default under Linux)
- Substitutes I/O, MPI and memory allocation/deallocation routines with instrumented calls
- Track interval events (e.g., time spent in write()) as well as atomic events (e.g., how much memory was allocated) in wrappers
- Accurately measure I/O and memory usage

# Tracking I/O in static binaries (IBM Blue Gene)

---

- The linker can substitute TAU's I/O wrapper and intercept POSIX I/O Calls
- We can track parameters that flow through the I/O calls
- Configure TAU with `-iowrappers`
- Use `-optTrackIO` in `TAU_OPTIONS`

# Tracking I/O in static binaries

---

# Issues

---

- Heap memory usage reported by the mallinfo() call is not 64-bit clean.
  - 32 bit counters in Linux roll over when > 4GB memory is used
  - We keep track of heap memory usage in 64 bit counters inside TAU
- Compensation of perturbation introduced by tool
  - Only show what application uses
  - Create guards for TAU calls to not track I/O and memory allocations/de-allocations performed inside TAU
- Provide broad POSIX I/O and memory coverage

# I/O Calls Supported

# TAU Integration with IDEs

---

- High performance software development environments
  - Tools may be complicated to use
  - Interfaces and mechanisms differ between platforms / OS
- Integrated development environments
  - Consistent development environment
  - Numerous enhancements to development process
  - Standard in industrial software development
- Integrated performance analysis
  - Tools limited to single platform or programming language
  - Rarely compatible with 3rd party analysis tools
  - Little or no support for parallel projects

# TAU and Eclipse

- Provide an interface for configuring TAU's automatic instrumentation within Eclipse's build system
- Manage runtime configuration settings and environment variables for execution of TAU instrumented programs

# TAU and Eclipse

The screenshot shows the Eclipse IDE interface with the following components:

- Navigator:** Shows a project named 'matmultiply' with a sub-project 'matmult.f90' selected. Other files include '.cdtbuild', '.cdtproject', '.project', and profile files.
- Editor:** Displays the Fortran source code for 'matmult.f90'. The code includes a subroutine 'initialize' that sets up matrices 'a' and 'b', and a subroutine 'multiply\_matrices' that performs the matrix multiplication. Comments describe the steps: 'first initialize the A matrix' and 'then initialize the B matrix'.
- Outline:** Lists the subroutines: 'initialize', 'multiply\_matrices', and 'main'.
- Problems/Console:** Shows the 'Performance Data Manager' (PerfDMF) interface. It displays a tree view with folders 'AORSA2D', 'matmultiply', 'Experiment', 'mm', and 'ring'. A specific performance data entry is highlighted: 'The New Trial: 2006-12-02 20:36:59'.

A text label 'PerfDMF' with an arrow points to the Performance Data Manager window.

# Choosing PAPI Counters with TAU in Eclipse

The screenshot shows the Eclipse IDE interface for configuring TAU profiling. The main window is titled "Profile" and contains a "PAPI Counters" dialog box. The dialog box has a title bar "PAPI Counters" and a subtitle "Select the PAPI counters to use with TAU". It features a list of PAPI counter names with checkboxes next to them. The following table shows the list of counters and their definitions as seen in the adjacent window:

Counter	Definition
PAPI_L1_DCM	Level 1 data cache misses
PAPI_L1_ICM	Level 1 instruction cache misses
PAPI_L2_DCM	Level 2 data cache misses
PAPI_L2_ICM	Level 2 instruction cache misses
PAPI_L1_TCM	Level 1 cache misses
PAPI_L2_TCM	Level 2 cache misses
PAPI_FPU_IDL	Cycles floating point units are idle
PAPI_TLB_DM	Data translation lookaside buffer misses
PAPI_TLB_IM	Instruction translation lookaside buffer misses
PAPI_TLB_TL	Total translation lookaside buffer misses
PAPI_L1_LDM	Level 1 load misses
PAPI_L1_STM	Level 1 store misses
PAPI_L2_LDM	Level 2 load misses
PAPI_L2_STM	Level 2 store misses
PAPI_STL_ICY	Cycles with no instruction issue
PAPI_HW_INT	Hardware interrupts
PAPI_BR_TKN	Conditional branch instructions taken
PAPI_BR_MSP	Conditional branch instructions mispredicted
PAPI_TOT_INS	Instructions completed
PAPI_FP_INS	Floating point instructions
PAPI_BR_INS	Branch instructions
PAPI_VEC_INS	Vector/SIMD instructions
PAPI_RES_STL	Cycles stalled on any resource
PAPI_TOT_CYC	Total cycles
PAPI_L1_DCH	Level 1 data cache hits
PAPI_L2_DCH	Level 2 data cache hits
PAPI_L1_DCA	Level 1 data cache accesses
PAPI_L2_DCA	Level 2 data cache accesses
PAPI_L2_DCR	Level 2 data cache reads
PAPI_L2_DCW	Level 2 data cache writes

The "PAPI Counters" dialog box shows the following list of counters with checkboxes:

- PAPI\_L1\_DCM
- PAPI\_L1\_ICM
- PAPI\_L2\_DCM
- PAPI\_L2\_ICM
- PAPI\_L1\_TCM
- PAPI\_L2\_TCM
- PAPI\_FPU\_IDL
- PAPI\_TLB\_DM
- PAPI\_TLB\_IM
- PAPI\_TLB\_TL
- PAPI\_L1\_LDM
- PAPI\_L1\_STM
- PAPI\_L2\_LDM
- PAPI\_L2\_STM
- PAPI\_STL\_ICY
- PAPI\_HW\_INT
- PAPI\_BR\_TKN
- PAPI\_BR\_MSP
- PAPI\_TOT\_INS
- PAPI\_FP\_INS
- PAPI\_BR\_INS
- PAPI\_VEC\_INS
- PAPI\_RES\_STL
- PAPI\_TOT\_CYC
- PAPI\_L1\_DCH
- PAPI\_L2\_DCH
- PAPI\_L1\_DCA
- PAPI\_L2\_DCA
- PAPI\_L2\_DCR
- PAPI\_L2\_DCW

The dialog box also includes buttons for "Select All", "Deselect All", "Counter Descriptions", "OK", and "Cancel".
